Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered. Data are available on CD, diskette, computer printout, microfiche and microfilm, and magnetic tape. Maps and other geographic reference materials are available for some types of data. Direct on line access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Population Estimates Section,
Demography Division

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 951-2320) or to the Statistics Canada reference centre in:

Halifax	(1-902-426-5331)	Regina	(1-206-780-5405)
Montreal	(1-514-283-5725)	Edmonton	(1-403-495-3027)
Ottawa	(1-613-951-8116)	Calgary	(1-403-292-6717)
Toronto	(1-416-973-6586)	Vancouver	(1-604-666-3691)
Winnipeg	(1-204-983-4020)		

Toll-free access is provided in all provinces and territories, for users who reside outside the focal dialing area of any of the regional reference centres.

Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes. Les données sont disponibles sur disque compact, disquette, imprimé d'ordinateur, microfiche et microfilm, et bande magnétique. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

Comment obtenir d'autres renseignements

Toute demande de renseignements au sujet de cette publication ou de statistiques et services connexes doit être adressée à la :

Section des estimations démographiques,
Division de la démographie

Statistique Canada, Ottawa, K1A 0T6 (téléphone : 951-2320) ou au centre de consultation de Statistique Canada à :

Halifax	(1-902-426-5331)	Regina	(1-206-780-5405)
Montreal	(1-514-283-5725)	Edmonton	(1-403-495-3027)

Note of Appreciation

*Canada owes the success of its statistical system to
a long-standing cooperation involving Statistics
Canada, the citizens of Canada, its businesses,
governments and other institutions. Accurate and
timely statistical information could not be produced
without their continued cooperation and goodwill.*

Note de reconnaissance

*Le succès du système statistique du Canada repose
sur un partenariat bien établi entre Statistique Canada
et la population, les entreprises, les administrations
canadiennes et les autres organismes. Sans cette
collaboration et cette bonne volonté, il serait impossible
de produire des statistiques précises et actuelles.*

This publication was prepared by:

The Population Estimates Section personnel and other members of the Demography Division.

HIGHLIGHTS

Population

At the National Level

- On July 1, 1971, Canada's population numbered 22.0 million inhabitants. Two decades later, on July 1, 1991, it reached 28.1 million - an increase of 6.1 million. This increase translates into a 1.2% average annual rate of growth.
- Considerable variation in the annual rate of growth was observed over the course of these two decades. The first five-year period, 1971-1976, was characterized by the relatively high average rate of 1.3%, reaching 1.5% in 1974-1975. The two subsequent five-year periods had lower annual rates of growth: 1.1% and 1.0% per year on average for 1976-1981 and 1981-1986, respectively. The lowest annual growth of the two decades (0.9%) was recorded in 1984-1985. In contrast, the 1986-1991 period was distinguished by relatively strong average growth of 1.4%, reaching 1.8% in 1988-1989 - the highest annual rate of the two decades.
- Natural increase was the main ingredient in the growth of the Canadian population during the two decades: 3.9 million (63.7%) of the 6.1 million total was accounted for by the difference between births and deaths. International migration (which comprises immigration and emigration, as well as the flows of non-permanent residents and returning Canadians) nonetheless played an important role. International migration is generally much less stable than natural increase from one year to another, and was responsible for the marked variations in growth over the two decades. The net international balance stood at 694,400 in 1971-1976, 492,600 in 1976-1981, 399,400 in 1981-1986, and finally at 983,200 in 1986-1991.

At the Provincial Level

- From 1971 to 1991, population growth varied sharply at the provincial and territorial level. The

FAITS SAILLANTS

Population

Au niveau national

- Le 1^{er} juillet 1971, la population du Canada se chiffrait à 22,0 millions d'habitants. Deux décennies plus tard, c'est-à-dire au 1^{er} juillet 1991, elle atteignait les 28,1 millions, ayant crû de 6,1 millions de personnes. Cette augmentation se traduit par un taux d'accroissement moyen de 1,2 % par année.
- On observe des variations considérables dans le taux d'accroissement annuel au cours de ces deux décennies. La première période quinquennale, 1971-1976, a été caractérisée par des taux relativement élevés: 1,3 % par année en moyenne, atteignant 1,5 % en 1974-1975. Les deux périodes quinquennales subséquentes ont connu des taux d'accroissement annuels plus faibles: 1,1 % (1976-1981) et 1,0 % (1981-1986) en moyenne. L'accroissement annuel le plus faible des deux décennies (0,9 %) est observé en 1984-1985. Par contre, la période 1986-1991 se distingue avec une croissance relativement forte: 1,4 % par année en moyenne, atteignant 1,8 % en 1988-1989, soit le taux annuel le plus élevé des deux décennies.
- C'est l'accroissement naturel (naissances moins décès) qui a le plus contribué à l'augmentation de la population canadienne au cours des deux décennies, soit 3,9 millions (63,7 %) sur une augmentation totale de 6,1 millions. La migration internationale (qui comprend l'immigration, l'émigration, ainsi que les flux des résidents non permanents et des Canadiens de retour) a néanmoins joué un rôle important. Généralement beaucoup moins stable que l'accroissement naturel d'année en année, c'est la migration internationale qui a engendré les fortes variations de croissance au cours des deux décennies. Le solde migratoire international se chiffrait à 694 400 personnes en 1971-1976, 492 600 en 1976-1981, 399 400 en 1981-1986 et, finalement, 983 200 en 1986-1991.

Au niveau provincial

- De 1971 à 1991, l'accroissement de la population a fortement varié au niveau des provinces et territoi-

Northwest Territories (2.6%), Alberta (2.2%), the Yukon (2.1%), British Columbia (2.1%) experienced higher rates than that of the national average (1.2%). Saskatchewan (0.4%), and Newfoundland (0.4%) showed the lowest growth. It is also noteworthy that Saskatchewan saw its population decline during certain years, specifically the beginning of the 1970s and the end of the 1980s. The same phenomenon was observed in Newfoundland toward the middle of the 1980s.

Population by age and sex

- The median age of the Canadian population has increased considerably during the past two decades, from 26.2 years in 1971 to 33.2 years in 1991. This increase of seven years is due to the aging trend in the population. The progression of the median age was most evident during the 1986-1991 period (a rise of 1.9 years).
- The aging process can also be seen in the provinces and territories, although in a different way. In 1991, the median age of the provinces and territories was in descending order: 34.3 years in British Columbia, 34.0 in Quebec, 33.2 in Nova Scotia and Ontario, 32.8 in Prince Edward Island, New Brunswick and Manitoba, 32.4 in Saskatchewan, 31.1 in Alberta, 30.7 in Newfoundland and Yukon, and finally 24.7 in the Northwest Territories.
- The population of Newfoundland has shown the strongest increase in median age, having increased from 20.9 years in 1971 to 30.7 years in 1991 - a rise of 9.8 years. The Northwest Territories where the median age has risen from 19.9 years in 1971 to 24.7 years in 1991, experienced the lowest increase - 4.8 years. During the entire period, British Columbia had the highest median age (27.8 years in 1971, 34.3 years in 1991).
- Another index of the aging of the Canadian population, the number of persons aged 65 and over, has risen from 1.8 million in 1971, to 3.2 million in 1991, which translates into a jump of 81.9%. During the same period, the proportion in this age group relative to the total population went

res. Les Territoires du Nord-Ouest (2,6 %), l'Alberta (2,2 %), le Yukon (2,1 %), la Colombie-Britannique (2,1 %) ont connu des taux supérieurs à la moyenne nationale (1,2 %). La Saskatchewan (0,4 %) et Terre-Neuve (0,4 %) ont présenté la croissance la plus faible. On note également que la Saskatchewan a vu sa population décroître au cours de certaines années, soit au début des années 1970 ainsi qu'à la fin des années 1980. Le même phénomène se produit à Terre-Neuve vers le milieu des années 1980.

Population selon l'âge et le sexe

- L'âge médian de la population canadienne a considérablement augmenté au cours des deux décennies, passant de 26,2 ans en 1971 à 33,2 ans en 1991. Cette augmentation de sept années s'inscrit dans la tendance au vieillissement démographique. La période 1986-1991 est celle où on observe la progression la plus marquée de l'âge médian (en hausse de 1,9 année).
- Ce processus caractérise aussi les provinces et territoires, quoique de façon différente. En 1991, l'âge médian de la population des provinces et territoires était, dans l'ordre décroissant: 34,3 ans en Colombie-Britannique, 34,0 au Québec, 33,2 en Nouvelle-Écosse et en Ontario, 32,8 à l'Île-du-Prince-Édouard, au Nouveau-Brunswick et au Manitoba, 32,4 en Saskatchewan, 31,1 en Alberta, 30,7 à Terre-Neuve et au Yukon et, finalement 24,7 dans les Territoires du Nord-Ouest.
- La population de Terre-Neuve manifeste la plus forte élévation de l'âge médian, qui y est passé de 20,9 ans en 1971 à 30,7 ans en 1991, soit une hausse de 9,8 années. Les Territoires du Nord-Ouest, où l'âge médian est passé de 19,9 ans en 1971 à 24,7 ans en 1991, ont quant à eux connu le plus faible vieillissement, soit 4,8 années. Durant toute la période observée, c'est en Colombie-Britannique que l'âge médian est le plus élevé (27,8 ans en 1971, 34,3 ans en 1991).
- Autre indice du vieillissement de la population canadienne, l'effectif des 65 ans et plus est passé de 1,8 million en 1971 à 3,2 millions en 1991, soit une hausse de 81,9 %. Au cours de cette même période, la proportion des personnes âgées dans la population passait de 8,0 % à 11,4 %. En 1971, l'Île-du-

from 8.0% to 11.4%. In 1971, Prince Edward Island (11.0%) and Saskatchewan (10.2%) had the highest proportion of those aged 65 and over. In 1991, Saskatchewan (14.0%), took first place, followed by Prince Edward Island (13.1%). Throughout the whole period, the Northwest Territories (2.3% in 1971, 2.7% in 1991), and the Yukon (2.9% in 1971, 3.9% in 1991) consistently showed the lowest proportions of persons aged 65 years and over.

- The proportion of the population aged 0 to 17 years has gradually diminished from 35.3% in 1971 to 24.8% in 1991, whereas the proportion of persons aged 18 to 64 years has grown from 56.6% to 63.8%. These changes in the distribution by age of the Canadian population have caused the dependency ratio (the proportion of persons aged 0-17 and 65 plus to persons aged 18-64) to decrease significantly from 76.6% in 1971 up to the end of the 1980s (56.0% in 1989) then rise slightly to 56.7% in 1991. Newfoundland exhibited the greatest variation in the dependency ratio - from 100.6% in 1971 to 59.6% in 1991, whereas Manitoba has exhibited the smallest - from 79.9% to 65.3%.
- In 1971, Canada had 101 males for every 100 females. As the number of women has grown more rapidly during the years that followed, this ratio has gradually diminished so that it stands at 98 males per 100 females in 1991. In 1971, with the exception of Quebec, all the provinces and territories had a higher proportion of males than females. In 1991, this was true only in the provinces of Newfoundland and Alberta, as well as in the two territories.

Population by marital status

- In 1991, 62.3% of persons aged 15 years and over were married (legally or common-law), singles represented 27.2% of the same age group, widows and widowers 6.2%, and divorcees 4.3%. With the exception of this last group, which has seen its relative importance grow considerably (it accounted for 1.2% in 1971), the distribution by marital status has remained approximately constant for the last two decades.

Prince-Édouard (11,0 %) et la Saskatchewan (10,2 %) comportaient la plus forte proportion de 65 ans et plus. En 1991, la Saskatchewan (14,0 %) avait devancé l'Île-du-Prince-Édouard (13,1 %). Tout au long de la période, les Territoires du Nord-Ouest (2,3 % en 1971, 2,7 % en 1991) et le Yukon (2,9 % en 1971, 3,9 % en 1991) ont présenté systématiquement les plus faibles proportions de 65 ans et plus.

- La proportion des jeunes (0 à 17 ans) a graduellement diminué, passant de 35,3 % en 1971 à 24,8 % en 1991, alors que celle des adultes de 18 à 64 ans a augmenté, passant de 56,6 % à 63,8 %. Ces changements dans la répartition par âge de la population canadienne ont entraîné une décroissance significative du rapport total de dépendance (c'est-à-dire le rapport des 0-17 ans et 65 ans et plus aux 18-64 ans de 1971 (76,6 %) jusqu'à la fin des années 1980 (56,0 % en 1989); on observe une légère hausse par la suite (56,7 % en 1991). Terre-Neuve présente la plus forte variation du rapport de dépendance, soit de 100,6 % en 1971 à 59,6 % en 1991, alors que le Manitoba présente la variation la plus faible, soit de 79,9 % à 65,3 %.
- En 1971, le Canada comptait 101 hommes pour 100 femmes. Le nombre de femmes s'étant accru plus rapidement que celui des hommes au cours des années qui ont suivi, ce rapport a graduellement diminué pour se situer à 98 hommes pour 100 femmes en 1991. En 1971, à l'exception du Québec, les provinces et territoires comptaient plus d'hommes que de femmes. En 1991, on observe une surmasculinité seulement à Terre-Neuve, en Alberta et dans les deux territoires.

Population selon l'état matrimonial

- En 1991, 62,3 % des 15 ans et plus étaient mariés (légalement ou de fait), les célibataires représentaient 27,2 % de la population âgée de 15 ans et plus, les veufs et veuves, 6,2 %, et les divorcés, 4,3 %. À l'exception de ces derniers, dont l'importance relative a augmenté considérablement (elle se situait à 1,2 % en 1971), la répartition par état matrimonial est demeurée approximativement constante au cours des deux décennies.

- In contrast, for some age groups, marital status evolved differently between 1971 and 1991. Among persons aged 18 to 24, singles increased (66.7% in 1971 compared to 79.7% in 1991) and married persons went from 32.9% to 19.9%. The relative preponderance of widows and widowers (0.2% and 0.1%), as well as that of divorcees, has remained constant (0.3%) for this age group.
- Par contre, dans certains groupes d'âge, l'état matrimonial a varié entre 1971 et 1991. Chez les 18-24 ans, la proportion des célibataires est passée de 66,7 % en 1971 à 79,7 % en 1991 et celle des mariés de 32,9 % à 19,9 %. L'importance relative des veufs et veuves (0,2 % et 0,1 %), ainsi que celle des divorcés est demeurée constante (0,3 %) dans ce groupe d'âge.
- In the same way, the proportion of singles among the 25 to 44 age group has grown from 13.4% in 1971 to 21.3% in 1991, while that of married persons declined from 84.1% to 73.5%. Widows and widowers have decreased in importance among this age group, their proportion having declined from 0.9% to 0.4%. In contrast, the relative importance of divorcees has increased from 1.7% to 4.8%, reflecting the growing number of divorces during the period.
- Similairement, la proportion des célibataires parmi les 25 à 44 ans a augmenté de 13,4 % en 1971 à 21,3 % en 1991, tandis que celle des mariés a diminué de 84,1 % à 73,5 %. Les veufs et veuves ont perdu de l'importance dans ce groupe d'âge, leur proportion passant de 0,9 % à 0,4 %. Par contre, l'évolution de la part relative des divorcés (1,7 % en 1971 et 4,8 % en 1991) reflète l'augmentation des divorces au cours des années.
- Over the course of this period, there was little change in the proportion of married persons aged 45 to 64 (82.3% in 1971 to 81.1% in 1991). In contrast, the relative importance of singles among this same age group has diminished (from 8.9% to 6.5%), as well as that of widows and widowers (from 7.1% to 5.2%). On the other hand, the proportion of divorcees climbed dramatically (from 1.7% to 7.1%).
- La proportion des personnes mariées chez les 45 à 64 ans a peu changé au cours de la période (82,3 % en 1971 et 81,1 % en 1991). Par contre, l'importance relative des célibataires dans ce groupe d'âge a diminué (passage de 8,9 % à 6,5 %), ainsi que celle des veufs et veuves (passage de 7,1 % à 5,2 %). À l'inverse, la part des divorcés de 1,7 % en 1971, a grimpé à 7,1 % en 1991.
- Married persons among those aged 65 and over rose from 53.7% to 56.9%. The proportion of divorcees among the same group also grew from 0.8% to 3.0%. In the opposite direction, singles have decreased (10.7% in 1971 and 7.4% in 1991) as did widows and widowers (from 34.7% to 32.7%, respectively).
- Chez les 65 ans et plus, la part des mariés est passée de 53,7 % à 56,9 %. Celle des divorcés a elle aussi augmenté, passant de 0,8 % à 3,0 %. À l'inverse, l'importance des célibataires accuse une réduction (10,7 % en 1971 et 7,4 % en 1991), de même que celle des veufs et veuves (34,7 % et 32,7 % respectivement).

Census Metropolitan Areas (CMAs)

- As of July 1, 1991, Canada's 25 CMAs were home to 17.2 million people, up from 15.7 million in 1986. In 1991, residents of CMAs accounted for 61.1% of the total population, up from 60.1% in 1986. While the overall CMA population increased by 9.2% between 1986 and 1991, the growth of individual CMAs during this period ranged between 1.6% and 18.4%.

Régions métropolitaines de recensement (RMR)

- Au 1^{er} juillet 1991, la population vivant dans les 25 RMR canadiennes était de 17,2 millions, contre 15,7 millions en 1986. En 1991, les résidents des RMR comptaient pour 61,1 % de la population totale, contre 60,1 % en 1986. Alors que l'ensemble des RMR a crû de 9,2 % entre 1986 et 1991, l'accroissement a varié de l'une à l'autre de 1,6 % à 18,4 %.

- Between 1986 and 1991, the CMA of Oshawa, Ontario, recorded the largest percentage growth in population (18.4%), followed by Kitchener, Ontario, (14.7%), Vancouver (13.6%), Ottawa-Hull (12.3%) and Toronto (12.0%). Migrants from elsewhere in Ontario accounted for the substantial increase in Oshawa's size. Four out of five migrants (82%) who moved to Oshawa during this period came from other areas in the same province, compared with 66% in Kitchener, 57% in Toronto, 43% in Ottawa-Hull and 42% in Vancouver. Migrants from other provinces represented about 36% of the people who moved to Ottawa-Hull, 31% in Vancouver, 15% in Kitchener, 12% in Toronto and only 10% in Oshawa. One of five people who moved to Toronto (22%) and Vancouver (21%) had immigrated from other countries, compared with 17% in Ottawa-Hull, 15% in Kitchener and only 6% in Oshawa. Non-permanent residents accounted for 7% of the migration to Toronto between 1986 and 1991, 5% for Vancouver, 3% for both Kitchener and Ottawa-Hull, and only 1% for Oshawa.
- Entre 1986 et 1991, la RMR d'Oshawa, Ontario, a connu l'accroissement relatif le plus élevé (18,4 %), suivi de Kitchener, Ontario, (14,7 %), Vancouver (13,6 %), Ottawa-Hull (12,3 %) et Toronto (12,0 %). Les migrants provenant d'ailleurs en Ontario ont contribué à l'accroissement considérable de la RMR d'Oshawa. Sur cinq migrants ayant élu résidence à Oshawa durant cette période, quatre (82 %) étaient originaires de la même province, comparé à 66 % pour Kitchener, 57 % pour Toronto, 43 % pour Ottawa-Hull, et 42 % pour Vancouver. Les migrants d'autres provinces représentaient environ 36 % des migrants vers Ottawa-Hull, 31 % vers Vancouver, 15 % vers Kitchener, 12 % vers Toronto et seulement 10 % vers Oshawa. Un migrant sur cinq ayant opté pour Toronto (22 %) et Vancouver (21 %) venait de l'étranger, comparé à 17 % pour Ottawa-Hull, 15 % pour Kitchener et seulement 6 % pour Oshawa. Les résidents non permanents comptent pour 7 % de la migration vers Toronto entre 1986 et 1991, 5 % pour Vancouver, 3 % pour Kitchener et Ottawa-Hull et seulement 1 % pour Oshawa.
- During the period from 1986 to 1991, Chicoutimi-Jonquière had the smallest percentage growth in population at 1.6%, followed by Regina (2.2%), Thunder Bay (2.4%), Windsor (3.3%), and Winnipeg and Saskatoon, each with 3.9%. The growth in these CMAs was the net result of high numbers of out-migrants, which offset any gains from in-migration and the excess of births over deaths. Most residents moving away from Chicoutimi-Jonquière (82%) moved elsewhere in Quebec. Similarly, 76% of the migrants from Windsor and 63% from Thunder Bay moved to other CDs in Ontario. Over half of those who left Regina, Saskatoon and Winnipeg (60%, 55% and 55%, respectively) moved to other provinces.
- Durant la période 1986-1991, Chicoutimi-Jonquière a connu le plus faible accroissement de population, soit 1,6 %, suivi de Regina (2,2 %), Thunder Bay (2,4 %), Windsor (3,3 %), et Winnipeg et Saskatoon, avec chacune 3,9 %. La croissance de ces RMR résultait d'un nombre élevé de sorties compensant les gains dus aux entrées migratoires et à l'excédent des naissances sur les décès. La plupart des résidents qui ont quitté Chicoutimi-Jonquière (82 %) se sont installés ailleurs au Québec. De la même façon, 76 % des sortants de Windsor et 63 % de Thunder Bay se sont dirigés vers d'autres DR en Ontario. Au-delà de la moitié de ceux qui ont quitté Regina, Saskatoon et Winnipeg (60 %, 55 % et 55 % respectivement) ont déménagé vers d'autres provinces.

Census Divisions (CDs)

- The 7.3% growth in Canada's population between 1986 and 1991 was not evenly distributed across the country's 290 census divisions (CDs). During this period, the population increased in nearly two out of three CDs (191) and declined in 99. Generally, the CDs with the largest percentage growth in population were

Divisions de recensement (DR)

- L'accroissement de 7,3 % observé pour la population canadienne entre 1986 et 1991 n'était pas distribué uniformément entre les 290 divisions de recensement (DR). Durant cette période, la population a augmenté dans deux DR sur trois (191) et a diminué dans les 99 autres. En général, les DR ayant les taux de croissance de population les plus

located near or in major urban centres. Those with little growth or declines were usually found in the more sparsely populated rural and/or northern areas.

- The 10 CDs with the largest population growth from 1986 to 1991 comprised four in the province of Quebec (Les Moulins, Thérèse-De Blainville, Mirabel and L'Assomption), three in Ontario (York, Durham and Peel) and three in British Columbia (Central Fraser Valley, Dewdney-Alouette and Squamish-Lillooet). In Ontario, the population increased in 94 % of the CDs, compared with 87 % in British Columbia, 74 % in Alberta, 67 % in New Brunswick and 65 % in Quebec. Half of Nova Scotia's CDs and all CDs in the northern territories also showed larger numbers.
- The CD with the largest percentage growth in population during the period from 1986 to 1991 was York in Ontario (43.3 %), followed by three CDs in Quebec, Les Moulins (32.8 %), Thérèse-De Blainville (31.4 %) and Mirabel (29.9 %), and Central Fraser Valley in British Columbia (29.7 %). All were located in or near a major census metropolitan area (CMA); York is part of the Toronto CMA, the Central Fraser Valley is near Vancouver, and Les Moulins, Thérèse-De Blainville and Mirabel are all part of the Montréal CMA.
- Almost everyone who moved to Les Moulins (97 %), Mirabel (96 %) and Thérèse-De Blainville (95 %) during the 1986 to 1991 period had moved from elsewhere within Quebec. Fewer of those who moved to York in Ontario and to British Columbia's Central Fraser Valley came from areas within the same province (81 % and 78 % respectively). Migrants from other provinces accounted for 16.7 % of people who moved to the Central Fraser Valley, compared with only 5.2 % in York, 2.5 % in each of Thérèse-De Blainville and Mirabel, and only 1.8 % in Les Moulins. A relatively large share of York's in-migration (10.4 %) was made up of immigrants, compared with 3.6 % in the Central Fraser Valley, 1.5 % in Thérèse-De Blainville, 1.3 % in Mirabel and less than 1 % in Les Moulins.

élevés étaient situées près ou dans des centres urbains majeurs. Les faibles croissances et les déclins caractérisaient des régions rurales ou nordiques à faible densité de population.

- Des 10 DR connaissant les plus forts accroissements entre 1986 et 1991, quatre se trouvaient au Québec (Les Moulins, Thérèse-De Blainville, Mirabel et l'Assomption), trois en Ontario (York, Durham et Peel) et trois en Colombie-Britannique (Central Fraser Valley, Dewdney-Alouette et Squamish-Lillooet). En Ontario, 94 % des DR ont connu un accroissement démographique, comparé à 87 % en Colombie-Britannique, 74 % en Alberta, 67 % au Nouveau-Brunswick et 65 % au Québec. La moitié des DR de la Nouvelle-Écosse et toutes les DR des territoires ont aussi connu un accroissement.
- La DR de York, Ontario, a connu le plus haut pourcentage de croissance démographique durant la période 1986-1991 (43,3 %), suivie de trois DR du Québec, Les Moulins (32,8 %), Thérèse-De Blainville (31,4 %) et Mirabel (29,9 %), et Central Fraser Valley en Colombie-Britannique (29,7 %). Toutes ces DR se situaient dans une région métropolitaine de recensement majeure ou à proximité; York fait partie de la RMR de Toronto, Central Fraser Valley est près de Vancouver, et Les Moulins, Thérèse-De Blainville et Mirabel font partie de la RMR de Montréal.
- Presque tous les migrants qui se sont installés dans les DR Les Moulins (97 %), Mirabel (96 %), et Thérèse-De Blainville (95 %) entre 1986 et 1991 venaient d'ailleurs au Québec. Les migrants vers York, Ontario, et Central Fraser Valley, Colombie-Britannique, provenaient en moindre proportion de leur propre province (81 % et 78 %) respectivement). Les migrants d'autres provinces comptent pour 16,7 % des entrées à Central Fraser Valley, comparé à seulement 5,2 % pour York, 2,5 % pour Thérèse-De Blainville et Mirabel, et seulement 1,8 % pour Les Moulins. Les immigrants comptent pour une large part des entrées à York (10,4 %), comparé à 3,6 % pour Central Fraser Valley, 1,5 % pour Thérèse-De Blainville, 1,3 % pour Mirabel et moins de 1 % pour Les Moulins.

- The 10 CDs with the largest percentage drops in population from 1986 to 1991 were in Saskatchewan (seven), Manitoba (two), and Quebec (one). In Saskatchewan, 83 % of the CDs lost residents between 1986 and 1991. Newfoundland, Prince Edward Island and Manitoba also suffered losses during this period, in 80 %, 67 % and 65 % of their CDs, respectively.
- Overall, CDs lost residents mainly because of relatively large out-migrations to other CDs in the same province, to those in other provinces, or both. Most out-migrants moved to another CD in the same province. Approximately 9 out of 10 people who moved in Quebec remained in the province. Interprovincial out-migration was more common in Manitoba and Saskatchewan.

Families

- On July 1, 1991, Census families in Canada numbered 7.4 million, a jump of 599,000 since 1986, which corresponds to an average rate of growth of 1.7 % annually. In the course of this five-year period, the annual rate of growth of families varied from 1.5 % (1986-1987), to 2.0 % (1988-1989). Only two provinces, Ontario (2.1 %), and British Columbia (2.7 %), had a higher rate of growth than the national average (1.7 %). The Yukon (4.0 %), and the Northwest Territories (2.5 %) have also benefitted from relatively strong growth. Saskatchewan has seen its number of families decline by an average of 0.3 % per year, whereas Manitoba experienced rather weak growth (0.7 %). These provinces registered considerable losses to interprovincial migration.
- In 1991, lone-parent families accounted for 13.0 % of census families. The province having the largest proportion of these families is Quebec (14.3 % in 1991). Nova Scotia (13.5 %) ranked second. The lowest proportion of lone-parent families was found in Saskatchewan (11.7 %) and Newfoundland (11.9 %).
- In the period between 1986 and 1991, the average rate of growth of lone-parent families

- Les 10 DR connaissant les baisses les plus importantes de population entre 1986 et 1991 sont situées en Saskatchewan (sept), au Manitoba (deux), et au Québec (une). En Saskatchewan, 83 % des DR ont perdu des résidents entre 1986 et 1991. Terre-Neuve, l'Île-du-Prince-Édouard et le Manitoba ont aussi subi des pertes durant cette période dans 80 %, 67 % et 65 % de leurs DR, respectivement.
- En général, les DR perdent des résidents principalement au profit de DR de la même province, d'autres provinces, ou les deux. La plupart des sortants se dirigent vers une DR de la même province. Approximativement 9 personnes sur 10 qui changent de lieu de résidence au Québec demeurent dans la province. Les migrants du Manitoba et de la Saskatchewan se dirigent plus vers d'autres provinces.

Familles

- Le 1^{er} juillet 1991, les familles de recensement au Canada se chiffraient à 7,4 millions, en hausse de 599 000 depuis 1986, ce qui correspond à un taux d'accroissement moyen de 1,7 % par an. Au cours de la période 1986-1991, la croissance des familles a varié entre 1,5 % (1986-1987) et 2,0 % (1988-1989). Seules deux provinces, l'Ontario (2,1 %) et la Colombie-Britannique (2,7 %), ont un accroissement supérieur à la moyenne (1,7 %). Le Yukon (4,0 %) et les Territoires du Nord-Ouest (2,5 %) ont aussi bénéficié d'une croissance relativement forte. La Saskatchewan a vu son effectif de familles décroître de 0,3 % en moyenne par année, alors que le Manitoba a connu une croissance relativement faible (0,7 %), ces deux provinces ayant enregistré des pertes considérables au plan de la migration interprovinciale.
- En 1991, les familles monoparentales représentaient 13,0 % des familles de recensement. La province où l'on retrouve la plus forte proportion de ces familles est le Québec (14,3 % en 1991). La Nouvelle-Écosse (13,5 %) vient au second rang. Les plus faibles proportions de familles monoparentales se retrouvent en Saskatchewan (11,7 %) et à Terre-Neuve (11,9 %).
- Au cours de la période de 1986 à 1991, le taux de croissance moyen des familles monoparentales

(2.2%), was greater than that of husband-wife families (1.6%). Three provinces: Ontario (3.2%), Alberta (2.6%) and Newfoundland (2.5%), had an average growth of lone-parent families that was above the overall average. The average rate of growth of husband-wife families for these provinces stood at 1.9%, 1.4% and 1.0%, respectively.

- British Columbia had (2.8%), the strongest average growth of husband-wife families. Apart from British Columbia, only Ontario (1.9%), saw its husband-wife families grow at a rate above the average (1.6%). It should be noted that in Saskatchewan, the number of husband-wife families fell by 0.4% per year on average, but the number of lone-parent families has increased by 0.8%.
- From 1986 to 1991, a slight increase in the number of childless husband-wife families was observed. Such families represented 37.5% of the overall total of husband-wife families in 1986, while in 1991, their proportion stood at 40.3%. Females continue to account for the majority of lone-parent family heads, equally in 1986 (82.3%) as in 1991 (82.4%). Furthermore, lone-parent families headed by women had a higher average rate of growth (2.2%), than did that of families headed by men (2.0%).

(2,2 %) a été supérieur à celui des familles époux-épouses (1,6 %). Dans trois provinces, l'Ontario (3,2 %), l'Alberta (2,6 %) et Terre-Neuve (2,5 %) l'accroissement des familles monoparentales a été supérieur à la moyenne. La croissance des familles époux-épouses pour ces mêmes provinces était de 1,9 %, 1,4 % et 1,0 % respectivement.

- La Colombie-Britannique (2,8 %) a connu la plus forte croissance moyenne des familles époux-épouses. À part celle-ci, seule l'Ontario (1,9 %) a connu une croissance de ce type de familles plus élevée que la moyenne (1,6 %). On note qu'en Saskatchewan le nombre de familles époux-épouses a diminué de 0,4 % par année en moyenne, mais que le nombre de familles monoparentales a augmenté de 0,8 %.
- De 1986 à 1991, on observe une légère progression des familles époux-épouses sans enfants. Celles-ci représentaient 37,5 % de l'ensemble des familles époux-épouses en 1986, alors qu'en 1991, cette proportion se situe à 40,3 %. Les familles monoparentales dont le parent est du sexe féminin se retrouvent en très grande majorité, autant en 1986 (82,3 %) qu'en 1991 (82,4 %). De plus, les familles monoparentales dont le chef est une femme ont connu un taux moyen d'accroissement plus élevé (2,2 %) que celles dont le chef est un homme (2,0 %).

INTRODUCTION

For some years, Statistics Canada has been reexamining the methods used for calculating population estimates. In 1993, following extensive research and lengthy consultation, Statistics Canada decided to incorporate net census undercoverage in the Population Estimates Programme. Although this decision reflected an ongoing effort to produce population estimates of the highest quality, it had substantial impact, not only on current estimates, but also on the historical series. Taking net undercoverage in Canada's population into account, resulted in an increase of 348,000 persons in 1971 and 791,000 in 1991. In order to better serve the needs of users, these estimates covering the period 1971-1991, have been collected in one volume entitled *Revised Intercensal Population and Family Estimates, July 1, 1971-1991*.

This publication is composed of three parts: the first part is explanatory, after underscoring the major features of the demographic evolution between 1971 and 1991, it discusses sources of data and methods, and offers a brief evaluation of the quality of the data presented in the statistical portion of the publication. The second part, which is essentially statistical, includes four types of tables: explanatory tables dealing with the quality of the estimates; tables presenting the population estimates by age, sex, and marital status for Canada, provinces and territories from 1971 to 1991; tables providing the total population and components of population growth for divisions and census metropolitan areas, from 1986 to 1991; and finally, tables covering census families from 1986 to 1991. In the third part, the reader will find a bibliography, information concerning the availability in electronic form of the data appearing in this publication, and a dictionary covering the principal demographic concepts.

INTRODUCTION

Depuis plusieurs années, Statistique Canada passait en revue les méthodes servant aux calculs des estimations de la population. En 1993, suite à des recherches étendues et à de nombreuses consultations, Statistique Canada décidait d'incorporer le sous-dénombrement net du recensement dans le Programme des estimations démographiques. Reflet d'un effort continu visant à produire les estimations de population les plus exactes, cette décision a eu des répercussions substantielles, non seulement au niveau des estimations courantes mais également des séries historiques. La prise en compte du sous-dénombrement net a eu pour effet d'accroître la population du Canada de 348 000 personnes en 1971 et de 791 000 en 1991. Afin de mieux servir les utilisateurs, ces estimations de 1971 à 1991 ont été regroupées dans un seul volume, intitulé *Estimations intercensitaires révisées de la population et des familles au 1^{er} juillet 1971 à 1991*.

Cette publication comprend trois parties: la première, plutôt explicative, après avoir souligné les faits saillants de l'évolution démographique de 1971 à 1991, fait référence aux sources de données et aux méthodes et offre une brève évaluation de la qualité des données présentées dans la partie statistique. La seconde partie, essentiellement statistique, comprend quatre types de tableaux: les tableaux explicatifs reliés à la qualité des estimations; ceux présentant les estimations de population selon l'âge, le sexe et l'état matrimonial pour le Canada, les provinces et les territoires de 1971 à 1991; ceux fournissant la population totale et les composantes de l'accroissement démographique des divisions et régions métropolitaines de recensement de 1986 à 1991; enfin ceux concernant les familles de recensement de 1986 à 1991. Dans la troisième partie, le lecteur retrouve une bibliographie, des renseignements au sujet de la diffusion électronique des données contenues dans cette publication ainsi qu'un lexique des principaux concepts démographiques.

DATA SOURCES

Base Data: Population and families

The 1971, 1976, 1981, 1986 and 1991 Censuses as well as the Reverse Record Check for Censuses prior to 1991.

Components

Vital statistics data on births and deaths, which are used to produce natural increase, are collected by the provinces. An agreement with the provincial governments grants Statistics Canada the right to process and release these data (Health Statistics Division). The marriage and divorce data used in the estimation of families are provided by the same source. The components of migratory change, with the exception of international migration, are not part of any systematic data collection scheme. Thus, while direct estimates of immigrants and non-permanent residents (NPRs) at the provincial level are provided by Citizenship and Immigration Canada, data on emigrants, subprovincial/territorial movement as well as returning Canadians must be derived from various administrative sources.

Text Table I provides a description and source for data used in estimating population, including those derived through the indirect estimation of migratory change.

SOURCES DE DONNÉES

Effectif de base: population et familles

Les effectifs de base sont tirés des recensements de 1971, 1976, 1981, 1986 et 1991 ainsi que de l'étude de la Contre-vérification des dossiers pour les recensements antérieurs à 1991.

Composantes

Les données sur l'accroissement naturel, naissances et décès, proviennent de l'état civil dont la tenue incombe aux provinces. Une entente avec les gouvernements provinciaux en confie le traitement et la diffusion à Statistique Canada (Division de la statistique sur la santé). Les données sur les mariages et les divorces utilisées pour l'estimation du nombre de familles proviennent de la même source. Les composantes de l'accroissement migratoire, à l'exception de l'immigration internationale, ne font pas l'objet d'une collecte systématique d'information. Ainsi, si on obtient directement les données sur les immigrants et les résidents non permanents au Canada au niveau provincial auprès de Citoyenneté et Immigration Canada, il faut dériver de divers fichiers administratifs l'information concernant les immigrants, les émigrants, les déplacements entre provinces et entre secteurs géographiques à l'intérieur des provinces et territoires ainsi que les Canadiens de retour.

Le tableau explicatif I illustre, dans le cas spécifique de la production des estimations de la population, la nature et la provenance des données, dont celles obtenues par des mesures indirectes et concernant l'accroissement migratoire.

METHODOLOGY

The publication *Population Estimation Methods, Canada* (Statistics Canada, Catalogue No. 91-528E) provides a detailed description of the methods used to produce the statistical tables related to population and family. Due to the decision to adjust the population for net census undercoverage and the addition of the non-permanent resident and returning Canadian components, modifications have been made to the methods outlined in the above publication. The following section provides these refinements.

Intercensal Estimates of Population and Census Families

• Canada, Provinces and Territories

Revised intercensal population estimates for the 1971-1991 period were produced in the following four stages:

- I. Development of the bases
- II. Production of the postcensal population estimates by age and sex
- III. Calculation of the intercensal population estimates by age and sex
- IV. Derivation of the intercensal population estimates by age, sex and marital status.

Below is a summary description of each stage.

I. Development of the bases

The base population for estimates is the census count of population. Five base populations (for 1971, 1976, 1981, 1986 and 1991) were prepared in view of estimating population for each province and territory. In general, the five following steps were involved:

- (1) adjustment of the 1981, 1986 and 1991 census population by age, sex and marital status to June 1 using the cohort component method (Statistics Canada, March 1987). As the 1971

MÉTHODOLOGIE

La publication *Méthodes d'estimation de la population, Canada* (n° 91-528F au catalogue, Statistique Canada) décrit, de façon détaillée, les méthodes utilisées pour produire les tableaux statistiques relatifs à la population et aux familles. À cause de la prise en compte du sous-dénombrement net au recensement, des résidents non permanents et des Canadiens de retour, des modifications ont dû être apportées à la méthodologie. La section suivante explicite ces modifications.

Estimations intercensitaires de la population et des familles de recensement

• Canada, provinces et territoires

Les estimations intercensitaires révisées de la population pour la période 1971-1991 ont été produites en quatre étapes:

- I. La préparation des populations de départ;
- II. la production des estimations postcensitaires de la population selon l'âge et le sexe;
- III. le calcul des estimations intercensitaires de la population selon l'âge et le sexe; et
- IV. l'établissement des estimations intercensitaires de la population selon l'âge, le sexe et l'état matrimonial.

Les paragraphes suivants décrivent brièvement chacune des étapes.

I. La préparation des populations de départ

Les estimations démographiques reposent sur l'énumération de la population canadienne au recensement. Cinq populations de départ (1971, 1976, 1981, 1986 et 1991) ont été préparées en vue d'estimer la population par province et territoire. En général, le calcul s'est déroulé comme suit:

- (1) ajustement de la population recensée en 1981, 1986 et 1991 selon l'âge, le sexe et l'état matrimonial au 1^{er} juin à l'aide de la méthode des composantes régionales (Statistique Canada, mars

and 1976 Censuses were held on June 1, no adjustment was necessary;

- (2) correction of the June 1 population for census net undercoverage;
- (3) addition or subtraction of the components of growth for the month of June relative to the census counts corrected in step (2) (the cohort method) to estimate the July 1 base population by age and sex;
- (4) derivation of the July 1 base population by age, sex and marital status by distributing the population by age and sex obtained in Step (3) by marital status according to the distribution observed as of June 1 after correction for net undercoverage (Step (2));
- (5) augmenting the counts from Step (4) by adding the estimate of non-permanent residents by age, sex and marital status except for 1991, as non-permanent residents were already included in the census counts - a result of an extension of the census universe.

Thus, the development of the base populations for revised intercensal population estimates encompasses two new elements, census net undercoverage and non-permanent residents. A description of the estimation methods to derive data for these elements follows.

Estimation of census net undercoverage

Net undercoverage is estimated as the difference between the number of persons not enumerated (undercoverage) and the number of persons who should not have been counted or who were counted more than once (overcoverage). For each province and territory:

$$NU_{a,s,m}^t = U_{a,s,m}^t - O_{a,s,m}^t$$

where:

$NU_{a,s,m}^t$ = net undercoverage of census "t" for age "a", sex "s" and marital status "m";

1987). Étant donné que les recensements de 1971 et 1976 ont eut lieu le 1^{er} juin, aucun ajustement n'est nécessaire;

- (2) correction de la population au 1^{er} juin pour le sous-dénombrement net au recensement;
- (3) estimation de la population de base au 1^{er} juillet par âge et sexe en additionnant ou soustrayant, de la population recensée corrigée dans l'étape (2), les composantes de l'accroissement pour le mois de juin;
- (4) estimation de la population de base au 1^{er} juillet par âge, sexe et état matrimonial, en distribuant la population par âge et sexe obtenue à partir de l'étape (3) par état matrimonial en suivant la distribution observée au 1^{er} juin, après correction pour le sous-dénombrement net (étape (2));
- (5) augmentation des effectifs de l'étape (4) en ajoutant l'estimation des résidents non permanents selon l'âge, le sexe et l'état matrimonial sauf en 1991, car les résidents non permanents étaient déjà compris dans les effectifs énumérés au recensement, suite à une extension de l'univers du recensement.

Ainsi, l'obtention des populations de départ des populations intercensitaires révisées comprend deux nouveaux éléments: le sous-dénombrement net au recensement et le nombre de résidents non permanents. La description des méthodes d'estimation utilisées pour dériver les données de ces deux éléments suit.

Estimation du sous-dénombrement net

Le sous-dénombrement net est obtenu par la différence entre le nombre de personnes non recensées (sous-dénombrement) et le nombre de personnes qui n'auraient pas dû être comptées ou qui ont été comptées plus d'une fois (surdénombrement). Pour chaque province et territoire:

où:

$NU_{a,s,m}^t$ = sous-dénombrement net au recensement «t» à l'âge «a», au sexe «s» et à l'état matrimonial «m»;

$U_{a,s,m}^t$ = undercoverage of census "t" for age "a", sex "s" and marital status "m";

$O_{a,s,m}^t$ = overcoverage of census "t" for age "a", sex "s" and marital status "m";

t = 1971, 1976, 1981, 1986, 1991.

For the adjustment of enumerated population, when available, estimates derived directly from the coverage studies were used. This implies the use of the estimates of total net undercoverage by province/territory and by broad age groups and by marital status at the Canada level for 1991, and; total undercoverage by province and the estimate of undercoverage by broad age groups and by marital status for the 10 provinces for 1971 to 1986. As the development of the base population requires detailed estimates of net undercoverage, these were derived through generation of additional data.

For 1991:

- (i) net undercoverage by age and sex for provinces and territories; and
- (ii) net undercoverage by age, sex and marital status for provinces and territories;

For 1971 to 1986 Censuses:

- (i) undercoverage by age and sex for provinces;
- (ii) overcoverage by province and then overcoverage by age, sex and province;
- (iii) net undercoverage for the Yukon and the Northwest Territories and then net undercoverage by age and sex; and
- (iv) net undercoverage by age, sex and marital status for provinces and territories.

$U_{a,s,m}^t$ = sous-dénombrement au recensement «t» à l'âge «a», au sexe «s» et à l'état matrimonial «m»;

$O_{a,s,m}^t$ = surdénombrement au recensement «t» à l'âge «a», au sexe «s» et à l'état matrimonial «m»;

t = 1971, 1976, 1981, 1986, 1991.

Quand cela s'est avéré possible, on a directement dérivé des estimations des études de couverture pour ajuster la population énumérée. Ceci implique le recours aux estimations de sous-dénombrement net de la population totale des provinces et territoires, de la population canadienne totale selon les grands groupes d'âge et l'état matrimonial en 1991 ainsi que le sous-dénombrement total par province et l'estimation du sous-dénombrement par grands groupes d'âge et état matrimonial pour les 10 provinces entre 1971 et 1986 inclusivement. Puisque le développement de la population de départ requiert des estimations détaillées du sous-dénombrement net, ces dernières ont été dérivées par la génération de données supplémentaires.

Pour 1991 :

- (i) les sous-dénombrement net par âge et sexe pour les provinces et territoires; et
- (ii) le sous-dénombrement net par âge, sexe et état matrimonial pour les provinces et territoires;

Pour les recensements de 1971 à 1986 :

- (i) le sous-dénombrement par âge et sexe pour les provinces;
- (ii) le surdénombrement par province, puis le surdénombrement par âge, sexe et province;
- (iii) le sous-dénombrement net pour le Yukon et les Territoires du Nord-Ouest puis le sous-dénombrement net par âge et sexe; et
- (iv) le sous-dénombrement net par âge, sexe et état matrimonial pour les provinces et les territoires.

The 1991 Census

Net undercoverage of total provincial/territorial population

Due to an overestimation of the net undercoverage of females aged 0-4 years compared with males of the same age (4.13% vs. 2.47% at the national level), the undercoverage figures for the 0-4 years group were subjected to a minor modification (Declos, 1993). The whole adjustment, made at the province/territory level, reduced the net undercoverage for Canada by approximately 16,000 in reference to the level measured by the coverage studies (Text Table II).

Net undercoverage of population by age and sex

The net undercoverage by age and sex for provinces and territories was produced in the following steps:

- (1) Estimation of net undercoverage by broad age groups (0-4, 5-14, 15-19, 20-24, 25-34, 35-44, 45-54, 55-64, 65+) and sex by province or territory through the application of an Empirical Bayes model to (1) the coverage studies estimates of total net undercoverage by province/territory, and (2) the total net undercoverage by broad age group and sex at the Canada level (Dick, 1992) (Text Table IV); this would reduce the effects of sampling error at this level of detail by smoothing the raw estimates from the coverage studies; the Empirical Bayes estimates then received a final adjustment to ensure that they conformed to the direct estimates of the coverage studies (Michalowski, 1993c);
- (2) Calculation of the provincial/territorial estimates of net undercoverage by five-year age group (with the last group being 90+) and sex using:
 - for ages 0 to 59 years - separation factors based on the coverage studies' estimates of net undercoverage by five-year age group and sex for Canada;

Le recensement de 1991

Sous-dénombrement net de la population totale des provinces et territoires

Comme les études de couverture surestimaient le sous-dénombrement net des filles âgées de 0-4 ans, si on le compare avec celui des garçons du même âge (4,13% vs 2,47% au niveau national), le sous-dénombrement net des filles âgées de 0-4 ans a été légèrement modifié (Declos, 1993). Cette rectification, faite au niveau provincial et territorial a réduit d'environ 16 000 le sous-dénombrement net pour le Canada, par rapport aux estimations des études de couverture (tableau explicatif II).

Sous-dénombrement net de la population par âge et sexe

On a estimé le sous-dénombrement net par âge et sexe pour les provinces et territoires comme suit:

- (1) Estimation du sous-dénombrement net par grands groupes d'âge (0-4, 5-14, 15-19, 20-24, 25-34, 35-44, 45-54, 55-64, 65+) et sexe au niveau provincial et territorial, en appliquant le modèle empirique de Bayes : (1) aux estimations de sous-dénombrement net total par province et territoire, et (2) aux estimations de sous-dénombrement net par grands groupes d'âge et sexe au niveau du Canada, tirées des études de couverture (tableau explicatif IV) (Dick, 1992). Ce procédé réduit les fluctuations d'échantillonnage puisqu'il lisse les résultats des études de couverture. Les estimations dérivées du modèle empirique de Bayes sont finalement ajustées de manière à faire correspondre les totaux aux estimations des études de couverture (Michalowski, 1993c);
- (2) Calcul du sous-dénombrement net des provinces et territoires, par groupe d'âge quinquennal (le dernier groupe étant 90 ans et plus) et sexe en utilisant:
 - pour les 0 à 59 ans : les facteurs de séparation basés sur les estimations de sous-dénombrement net par groupe d'âge quinquennal et sexe pour le Canada, calculés à partir des études de couverture;

- for ages 60 years and over - the 1991 Census distribution of the Canadian population aged 60 years and over by age and sex was applied to the coverage studies' estimates by sex and province for the age group 60 years and over (separation factors based on the coverage studies were judged to be too unreliable for the population 60 years and over);

- (3) Estimation of the provincial/territorial net undercoverage by single year of age and sex by applying Sprague's multipliers to the estimates obtained in (2).

Net undercoverage of population by age, sex, marital status

The distribution by age, sex and marital status of estimates of net "missed" persons were generated through the following steps:

- (1) Calculation of the net census undercoverage by sex, marital status and province/territory for broad age groups by using the raking procedure based on:

- net undercoverage by broad age group, sex, province or territory obtained in Step (1) of the procedure used to generate age-sex estimates, and;
- net undercoverage by marital status and sex for Canada provided by the 1991 coverage studies (Text Table V).

- (2) Breaking-down the estimates obtained in (1) by five-year age groups using the same separation factors in (2) page 24, for each marital status by age and sex;

- (3) Generating raw estimates obtained in (2) by single year of age by calculating the net undercoverage rate by five-year age group and sex and applying these rates to the census population by single-year of age, sex and marital status to obtain the number of "missed" persons (the assumption was made that the net undercoverage rate is constant for each single-year of age within the same five-year age

- pour les 60 ans et plus: la distribution de la population canadienne âgée de 60 ans et plus par âge et sexe au recensement de 1991 a été appliquée aux estimations des études de couverture par sexe et province pour le groupe 60 ans et plus (on a jugé que les facteurs de séparation calculés pour ce groupe à partir des études de couverture n'étaient pas assez fiables);

- (3) Calcul du sous-dénombrement net des provinces et territoires par année d'âge et sexe en éclatant les estimations obtenues en (2) à l'aide des multiplicateurs de Sprague.

Sous-dénombrement net de la population par âge, sexe et état matrimonial

On a obtenu la répartition par âge, sexe et état matrimonial de l'effectif net «manqué» par le recensement comme suit :

- (1) Calcul du sous-dénombrement par sexe, état matrimonial et province ou territoire pour des groupes d'âge étendus à l'aide de la méthode itérative des quotients :

- le sous-dénombrement net par grand groupe d'âge, sexe, province ou territoire obtenu à l'étape (1) de la sous-section sur le sous-dénombrement net par âge et sexe; et
- le sous-dénombrement net par état matrimonial et sexe pour le Canada provenant des études de couverture de 1991 (tableau explicatif V).

- (2) Éclatement des estimations obtenues en (1) par groupes d'âge quinquennaux en appliquant à chacun des états matrimoniaux, les facteurs de séparation utilisés au point (2) page 24;

- (3) Éclatement des résultats obtenus en (2) par année d'âge en calculant dans un premier temps les taux de sous-dénombrement net par sexe et groupe d'âge quinquennal et en les appliquant par la suite à la population recensée par âge, sexe et état matrimonial. On obtient ainsi le nombre de personnes «manquées». L'hypothèse sous-jacente est que le taux de sous-dénombrement net est, à chacune des années

group and equal to the five-year age group rate);

- (4) Adjusting the distributions obtained in (3) by marital status in order to correspond to the initial number of missed persons for each age by sex.

The 1971 to 1986 Censuses

Net undercoverage, total population of 10 provinces

In order to calculate net undercoverage for each province, the undercoverage estimates for 1971, 1976, 1981 and 1986 as measured by the Reverse Record Check (RRC) surveys were decreased by subtracting the estimated overcoverage (not measured by the RRC). Additionally, for 1986, the RRC estimates were augmented by the estimates of persons living on incompletely enumerated Indian reserves. Overcoverage was estimated as follows (Michalowski, 1993c):

$$O_p^t = (U + RA)_p^t * \left[\frac{O_c^{91}}{(U + RA)_c^{91}} \right]$$

where:

O = overcoverage;

U = undercoverage;

RA = adjustment of undercoverage for misclassified dwellings and people not enumerated because they were away from their usual place of residence on Census day;

$\frac{O_c^{91}}{(U + RA)_c^{91}}$ = ratio of overcoverage to undercoverage (augmented by RA) for the 1991 Census population of 10 provinces with the exclusion of non-permanent residents;

p = province;

d'âge comprises dans un groupe quinquennal donné, égal à celui du groupe;

- (4) Ajustement des distributions obtenues en (3) par état matrimonial de façon à retrouver, par sexe, le nombre net de personnes manquées à chaque âge.

Les recensements de 1971 à 1986

Sous-dénombrement net de la population totale des 10 provinces

Afin de calculer le sous-dénombrement net pour chaque province, les mesures du sous-dénombrement de 1971, 1976, 1981 et 1986 résultant de la Contre-vérification des dossiers (CVD) ont été défalquées de l'estimation du surdénombrement (non mesuré par la CVD). De plus, on a compensé les données tirées de la CVD de 1986 pour le dénombrement partiel des réserves indiennes. On a estimé le surdénombrement de la façon suivante (Michalowski, 1993c):

$$\left[\frac{O_c^{91}}{(U + RA)_c^{91}} \right]$$

où:

O = surdénombrement;

U = sous-dénombrement;

RA = ajustement du sous-dénombrement pour les logements classés par erreur comme inoccupés et celui des personnes non énumérées dû à leur absence de leur lieu habituel de résidence le jour du recensement;

$\frac{O_c^{91}}{(U + RA)_c^{91}}$ = rapport du surdénombrement au sous-dénombrement (augmenté des RA), calculé pour le Canada sans les territoires et à l'exclusion des résidents non permanents, à partir des données de 1991;

p = province;

c = the ten provinces of Canada;

t = 1971, 1976, 1981, 1986.

c = les dix provinces du Canada;

t = 1971, 1976, 1981, 1986.

The 1991 overcoverage and undercoverage used to estimate the 1971 to 1986 overcoverage level excludes non-permanent residents since they were not part of the census universe or the RRC prior to 1991.

In 1986, an estimated 6,000 persons (Badets, 1991) were non-permanent residents and should not, therefore, have been enumerated. They were added to the estimates of 1986 Census overcoverage.

Net undercoverage of provincial population by age and sex

For the 1971 to 1986 Censuses, undercoverage and overcoverage by age and sex for each province have been estimated separately (Michalowski, 1993b and 1993c).

The estimates of undercoverage from 1971 to 1986 were produced using the same three step procedure as for the derivation of the 1991 provincial/territorial net undercoverage by age and sex.

The estimation procedure for provincial overcoverage by age and sex is consistent with the procedure for estimation of total overcoverage at the provincial level. Finally, the 6,000 non-permanent residents enumerated in the 1986 Census were distributed by age, sex and province based on the characteristics of the 1986 estimate of non-permanent residents derived from information provided by the Citizenship and Immigration Canada Visitor Data System (VIDS) (for more detailed information please refer to the next section of this publication).

The procedure for the derivation of provincial estimates of net undercoverage by age and sex in the censuses prior to 1991 is presented in a concise way in Diagram 1.

Les résultats des études de couverture de 1991 qu'on utilise pour l'estimation du surdénombrement de 1971 à 1986 excluent les résidents non permanents, puisqu'ils ne faisaient pas partie de l'univers des recensements et des CVD antérieurs à 1991.

En 1986, on évalue que 6 000 résidents non permanents ont été recensés (Badets, 1991); par définition, ils n'auraient pas dû l'être. On les a intégrés au calcul du surdénombrement du recensement de 1986.

Sous-dénombrement net de la population des provinces selon l'âge et le sexe

Pour les recensements de 1971 à 1986, nous avons estimé séparément le sous-dénombrement et le surdénombrement par âge et sexe pour chaque province (Michalowski, 1993b et 1993c).

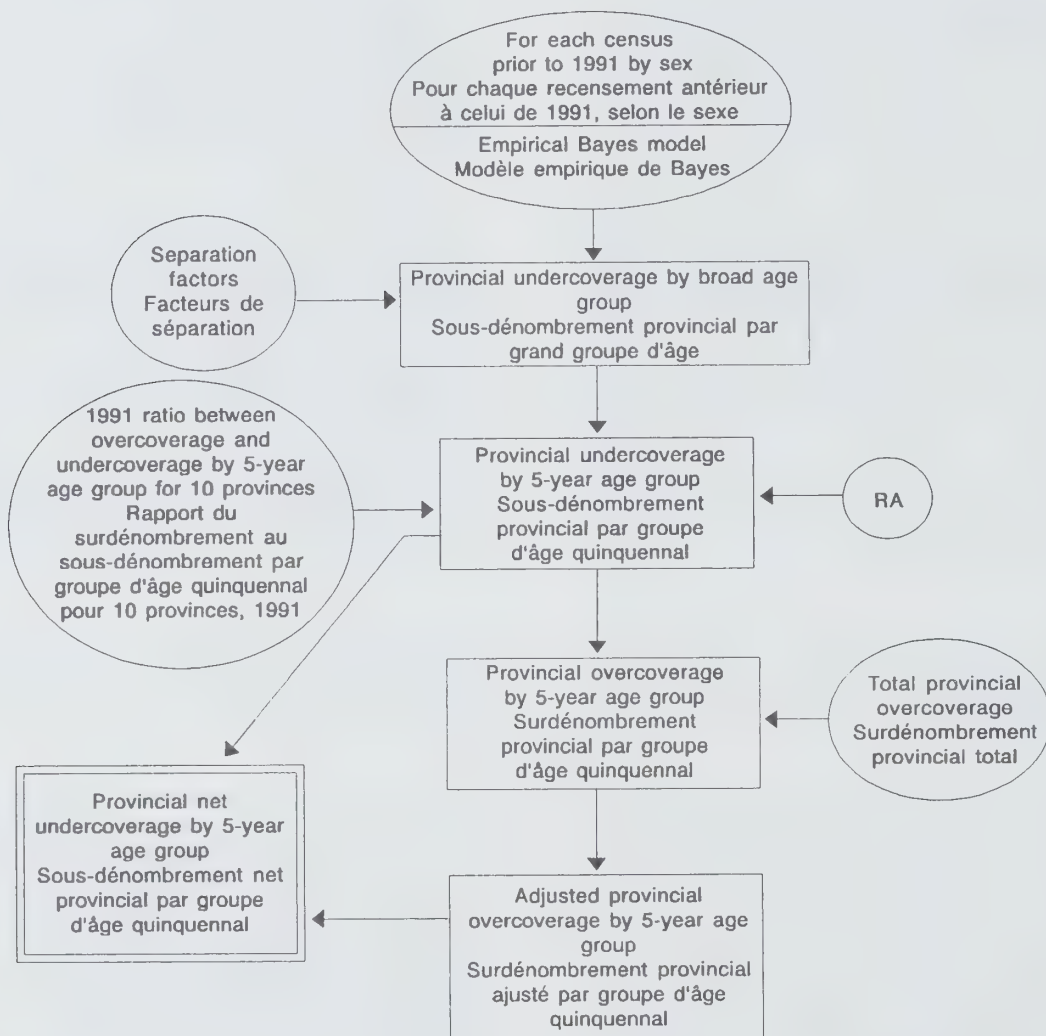

Les estimations par âge et sexe du sous-dénombrement au niveau provincial, de 1971 à 1986, ont été produites selon les mêmes étapes que celles du sous-dénombrement net de 1991.

Au niveau provincial, la méthode d'estimation du surdénombrement par âge (groupe d'âge quinquennal) et sexe est identique à celle de l'estimation du surdénombrement total. Enfin, les 6 000 résidents non permanents dénombrés au recensement de 1986 ont été répartis par âge, sexe et province, à partir des caractéristiques des résidents non permanents de 1986 fournies par le Système de données des visiteurs de Citoyenneté et immigration Canada (SDV) (pour de plus amples renseignements, veuillez vous référer à la prochaine section de cette publication).

Le mode de calcul du sous-dénombrement net par provinces, âge et sexe pour les recensements préalables à celui de 1991 est présenté au diagramme 1.

Diagram 1. Algorithm for Calculation of Provincial Net Undercoverage Prior to 1991

Diagramme 1. Algorithme pour le calcul du sous-dénombrement net provincial avant 1991

Territorial net undercoverage

Since the RRC estimates of undercoverage did not include the territories prior to 1991, the 1971 to 1986 net undercoverage was estimated using data on undercoverage for the 10 provinces in addition to the 1991 ratio between net undercoverage of each territory in reference to the 10 provinces.

$$NU_j^t = NU_c^t * \left[\frac{NU_j^{91}}{NU_c^{91}} \right]$$

where:

NU_j^t = net undercoverage for territory "j" in census "t";

NU_c^t = net undercoverage for the sum of the 10 provinces for census "t" (excluding non-permanent residents);

NU_j^{91} = net undercount for territory "j" in 1991;

NU_c^{91} = net undercount for the sum of the 10 provinces in 1991 (excluding non-permanent residents).

In order to obtain net undercoverage by five-year age group and sex, the net undercoverage estimates were prorated using net undercoverage by age and sex for the 1991 Census population excluding non-permanent residents.

The procedure for the derivation of the estimates of territorial net undercoverage by age and sex in the censuses prior to 1991 is presented in Diagram 2.

Sous-dénombrement net dans les territoires

Puisque les estimations obtenues par la CVD ne comprenaient pas les territoires avant 1991, on a dû estimer le sous-dénombrement net pour les années 1971 à 1986 à partir des données sur le sous-dénombrement dans les 10 provinces et du rapport entre le sous-dénombrement net dans les 10 provinces et celui des territoires, obtenu en 1991.

où:

NU_j^t = sous-dénombrement net pour un territoire «j» au recensement «t»;

NU_c^t = sous-dénombrement net pour la somme des 10 provinces au recensement «t» (excluant les résidents non permanents);

NU_j^{91} = sous-dénombrement net pour un territoire «j» en 1991;

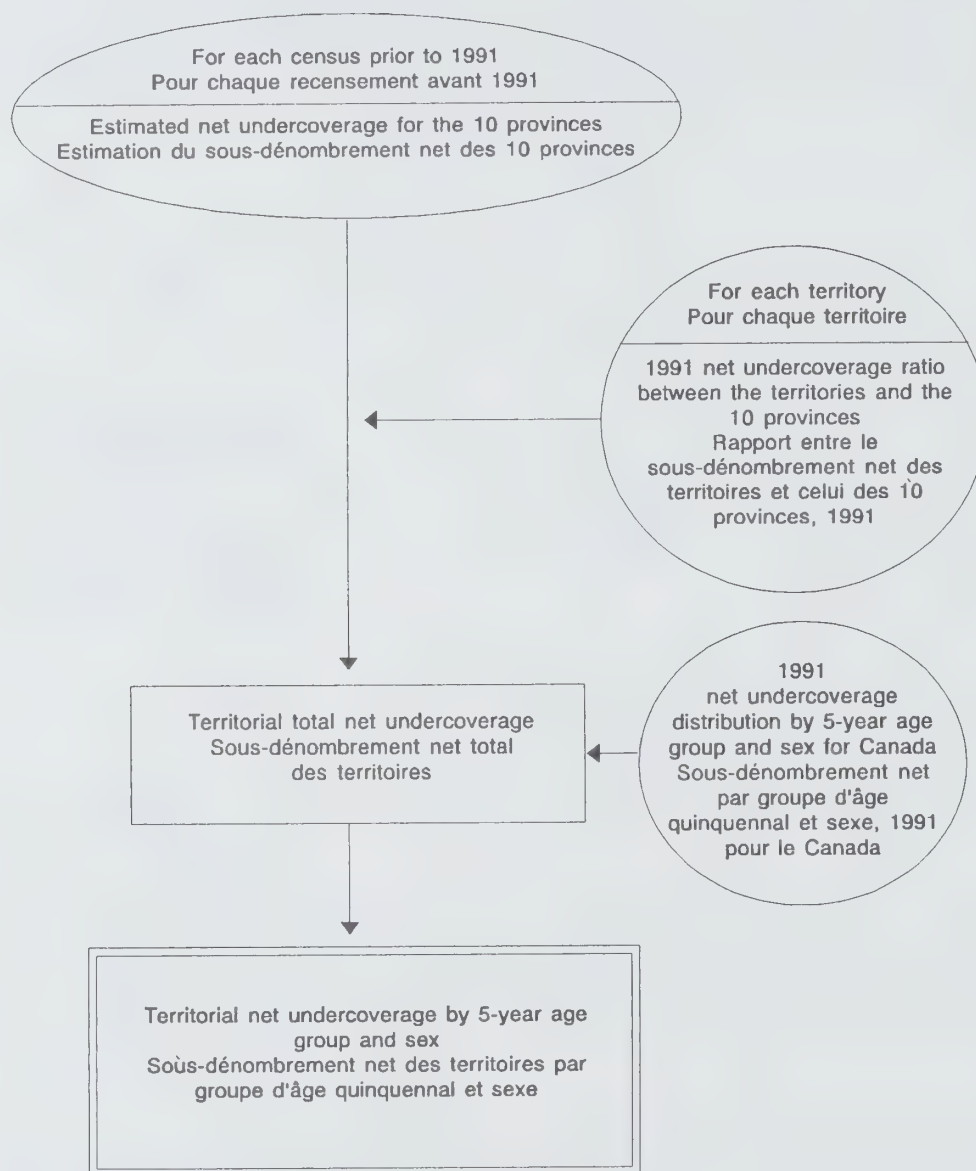

NU_c^{91} = sous-dénombrement net pour la somme des 10 provinces en 1991 (excluant les résidents non permanents).

Afin d'obtenir le sous-dénombrement net par groupe d'âge quinquennal et sexe, on a éclaté l'estimation du sous-dénombrement net total à l'aide de la répartition par âge et sexe du sous-dénombrement net au recensement de 1991, à l'exclusion des résidents non permanents.

Le mode de calcul du sous-dénombrement net par âge et sexe des territoires pour les recensements antérieurs à celui de 1991 est illustré par le diagramme 2.

Diagram 2. Algorithm for Calculation of Net Undercoverage Prior to 1991 for the Territories

Diagramme 2. Algorithme pour le calcul du sous-dénombrement net des territoires avant 1991

Net undercoverage by age, sex and marital status for provinces and territories

These estimates were generated applying basically the same four-step procedure as that used to produce estimates of net undercount in the 1991 Census by age, sex and marital status. Step (1) of this procedure was extended to derive net undercoverage by sex and marital status at the Canada level which was unavailable in the 1971 to 1986 Censuses. As the RRC studies conducted prior to 1991 provide data on undercoverage only for Canada excluding the territories, an adjustment was introduced to take provincial overcoverage and territorial net undercoverage into account (Michalowski, 1994). This was done using the following formula:

$$NU_m^t = U_m^t * [NU_{C(12)}^t / U_{C(10)}^t]$$

where:

NU_m^t = net undercoverage for marital status "m" in census "t";

U_m^t = undercoverage for marital status "m" in census "t";

$NU_{C(12)}^t$ = net undercoverage as estimated for provinces and territories in census "t";

$U_{C(10)}^t$ = undercoverage for 10 provinces in census "t";

m = corresponding to "single", "married", "widowed" and "divorced";

t = 1971, 1976, 1981, 1986.

Incorporation of non-permanent residents

The non-permanent resident population consists of persons residing temporarily in Canada who are holders of at least one of the following documents: employment

Sous-dénombrement net par âge, sexe et état matrimonial dans les provinces et territoires

Le mode de calcul pour les recensements antérieurs à 1991 suit celui (quatre étapes) utilisé pour estimer le sous-dénombrement net de 1991, selon l'âge, le sexe et l'état matrimonial. On a dû ajouter à la première étape, le calcul du sous-dénombrement net par sexe et état matrimonial pour le Canada, non disponible pour la période de 1971 à 1986. En effet, la CVD n'offrant de données que sur le sous-dénombrement au Canada, territoires non inclus, on a dû faire un ajustement pour tenir compte du surdénombrement et du sous-dénombrement net dans les territoires (Michalowski, 1994). Pour ce faire, on a utilisé la formule suivante :

où:

NU_m^t = sous-dénombrement net pour l'état matrimonial «m» au recensement «t»;

U_m^t = sous-dénombrement pour l'état matrimonial «m» au recensement «t»;

$NU_{C(12)}^t$ = sous-dénombrement net tel qu'estimé pour le Canada, provinces et territoires lors du recensement «t»;

$U_{C(10)}^t$ = sous-dénombrement pour le Canada, territoires non inclus, au recensement «t»;

m = correspond aux états matrimoniaux: «célibat», «mariage», «veuvage» et «divorce»;

t = 1971, 1976, 1981, 1986.

Incorporation des résidents non permanents

Les résidents non permanents sont des personnes qui résident au Canada de façon temporaire et qui détiennent au moins l'un des permis suivants : de travail, d'études,

authorization, student authorization, minister's permit or refugee claimants and their non-Canadian-born dependents. Data on non-permanent residents (NPRs) used to adjust the 1971, 1976, 1981, 1986 base populations consist of the estimates of non-permanent residents by age, sex, marital status and province/territory as of July 1. The NPR annual stock estimates by the above characteristics are available for years 1971 to 1991. However, different estimation procedures were used to produce estimates for the 1971 to 1980 and 1981 to 1991 periods (Michalowski, 1993a and 1993e). They are briefly described below.

Non-permanent Residents, 1971 to 1980

To adjust the 1971 and 1976 base populations (as well as the annual estimates for the 1971 to 1980 period), estimates of NPRs were derived in three steps:

- (1) total number for Canada (stock as of June 1) (Text Table III);
- (2) number by age, sex and marital status for provinces and territories as of June 1;
- (3) provincial/territorial total number and by age, sex and marital status as of July 1.

The annual total number of NPRs for the 1971 to 1980 period was estimated using available information from different sources (Declos, 1993).

The distribution of the estimates of NPRs by age, sex and province/territory in the 1971 to 1980 period was derived using (VIDS) for the 1981 to 1985 period. In particular:

- in 1971, using the average of the proportion of NPRs by age, sex, province/territory for the 1981-1985 period;
- in 1972 through 1980, based on a linear interpolation between the 1971 and 1981 distributions.

Finally, for each province/territory, the marital status distribution by sex was assumed to be constant over the whole period and equal to the average distribution for the 1981-1985 period. Thus, the estimates by age and

ministériel ou bien de revendicateur du statut de réfugié, de même que tous leurs dépendants nés à l'extérieur du Canada. Les données sur les résidents non permanents utilisées pour ajuster les populations de départ de 1971, 1976, 1981 et 1986 sont celles des résidents non permanents par âge, sexe et province ou territoire au 1^{er} juillet. L'estimation des stocks annuels de résidents non permanents selon les caractéristiques mentionnées ci-haut est disponible pour les années 1971 à 1991. Toutefois, les méthodes utilisées pour l'estimation des résidents non permanents diffèrent pour les périodes 1971-1980 et 1981-1991 (Michalowski, 1993a et 1993e). Ces méthodes sont décrites ci-après :

Résidents non permanents, 1971 à 1980

Pour ajuster les populations recensées en 1971 et 1976 (de même que les estimations de la période 1971-1980), on leur a ajouté les résidents non permanents estimés en trois étapes :

- (1) effectif total pour le Canada (stock au 1^{er} juin) (tableau explicatif III);
- (2) effectif selon l'âge, le sexe et l'état matrimonial pour les provinces et territoires au 1^{er} juin;
- (3) effectif total des provinces et territoires selon l'âge, le sexe et l'état matrimonial au 1^{er} juillet.

L'effectif annuel total des résidents non permanents pour la période 1971-1980 a été estimé à partir des diverses sources disponibles (Declos, 1993).

La ventilation par province, sexe et âge des résidents non permanents au cours de la période 1971 à 1980 est dérivée des fichiers SDV de Citoyenneté et Immigration Canada de 1981 à 1985, de la façon suivante :

- en 1971, à l'aide de la répartition moyenne des résidents non permanents par âge, sexe, province ou territoire de la période 1981-1985;
- de 1972 à 1980, par interpolation linéaire entre les distributions de 1971 et 1981.

Enfin, on a présumé que, pour chaque province et territoire, la distribution par état matrimonial de l'un et l'autre sexe était constante sur toute la période, et équivalente à la distribution moyenne de la période 1981-1985. De plus,

marital status were derived using previously developed estimates by age and the above assumption.

Provincial/territorial estimates of the total number of NPRs as of July 1 of a particular year were produced by applying the average change in stock between June 1 and July 1 estimates as observed in the 1982 to 1984 period to the June 1 stock estimates. In the last step, the July 1 estimate was distributed by age, sex and marital status using the same-year June 1 distribution by these characteristics.

Non-permanent residents, 1981 to 1991

For the 1981 and 1986 base populations (Text Table III) and the rest of the intercensal annual estimates for the 1981 to 1991 period), the estimates of NPRs by age, sex, marital status and province/territory were produced using data available from VIDS, Citizenship and Immigration Canada. As this system is a register of documents and extensions to documents issued to visitors to Canada, data from the system must be converted into counts of NPRs (Michalowski and Fortier, 1990). First, the stock data by age, sex, marital status and province/territory as of July 1 were derived directly from VIDS. In the next step, these data were adjusted to take into account:

- (1) Refugee claimant backlog clearance (estimates for 1989 to 1991)

The nature of VIDS implies that all backlog refugee status claimants would be included in the estimates of NPRs for the entire valid period of their employment authorization (the beginning of 1989 to September 1991); however, according to the Refugee Backlog Clearance Programme, processing of refugee claims took place over a period of several years and, for this reason, adjustment was necessary.

- (2) The underestimate for age groups 0-4, 5-9 and 55 years and over (1987 to 1991).

A comparison between the 1991 VIDS-based estimates of NPRs and the 1991 Census counts of NPRs revealed an undercount for the above age groups originating from the nature of

la ventilation par âge et état matrimonial est fondée sur la répartition par âge décrite ci-dessus, et repose sur l'hypothèse mentionnée ci-haut.

Le passage de l'effectif total des résidents non permanents de chaque province ou territoire au 1^{er} juin à celui du 1^{er} juillet, pour une année particulière, a été effectué en appliquant l'accroissement moyen du stock observé entre les 1^{er} juin 1982 et 1984, à l'effectif estimé au 1^{er} juin. En dernier lieu, l'effectif au 1^{er} juillet a été ventilé par âge, sexe et état matrimonial en utilisant les distributions correspondantes au 1^{er} juin.

Résidents non permanents, 1981 à 1991

Les effectifs des résidents non permanents par âge, sexe, province ou territoire, pour 1981 et 1986, de même que pour les années intercensitaires de la période 1981-1991, proviennent du SDV du ministère de la Citoyenneté et Immigration Canada (tableau explicatif III). Le fichier des visiteurs constitue un registre des permis (ou de leur renouvellement) délivrés aux visiteurs qui résident au Canada. Ces données doivent donc être converties en compte réel de résidents non permanents (Michalowski et Fortier, 1990). On détermine d'abord les effectifs au 1^{er} juillet, par âge, sexe et état matrimonial. Puis on les ajuste pour tenir compte de :

- (1) L'arriéré du traitement des revendications du statut de réfugié (estimations de population entre 1989 et 1991)

La structure du SDV implique que les revendicateurs du statut de réfugié constituant l'arriéré y seraient inclus dans les estimations des résidents non permanents de façon continue depuis le début de 1989 jusqu'à l'expiration de leur permis de travail, soit septembre 1991. Cependant, le programme d'élimination de l'arriéré des réfugiés s'est étendu sur une période de plusieurs années, de sorte qu'il a fallu ajuster l'estimation dérivée du fichier des visiteurs.

- (2) La sous-estimation des effectifs des groupes d'âge 0-4, 5-9 et 55 ans et plus (1987 à 1991).

Une comparaison du nombre de résidents non permanents estimé à partir du fichier des visiteurs et de celui du recensement de 1991 a révélé que le fichier des visiteurs sous-estime les groupes

VIDS. Corrections to the estimates for the above age groups were made using the 1991 Census counts of NPRs adjusted for net under-coverage and for the age-sex distribution of landed immigrants over the 1989-1991 period (Michalowski, 1993e; and Declos, 1993).

II. Production of the postcensal population estimates by age and sex

For the 1971 to 1991 period, the postcensal population estimates by age and sex were obtained by the component method. The demographic events (components of population change) which occurred between July 1 of the base year of the postcensal period and each following year of this period are added to or subtracted from the base population. Diagram 3 presents the estimation procedure, and indicates that a new component, "returning Canadians", was added to the procedure before revisions were made. Moreover, to reflect the change of the census population universe made in 1991, non-permanent residents were incorporated into the estimates. Finally, the annual estimate of components was adjusted to reflect the July 1 reference date.

The following describes the way the new components of population change (returning Canadians (CRs) and non-permanent residents (NPRs)) as well as changes in estimates of emigration were incorporated into the estimation procedure.

sus-mentionnés. La correction utilise les effectifs de résidents non permanents provenant du recensement de 1991, ajustés pour le sous-dénombrement net, ainsi que la distribution par âge et sexe des immigrants reçus de la période 1989 à 1991. (Michalowski, 1993e; et Declos, 1993).

II. Production des estimations postcensitaires de la population par âge et sexe

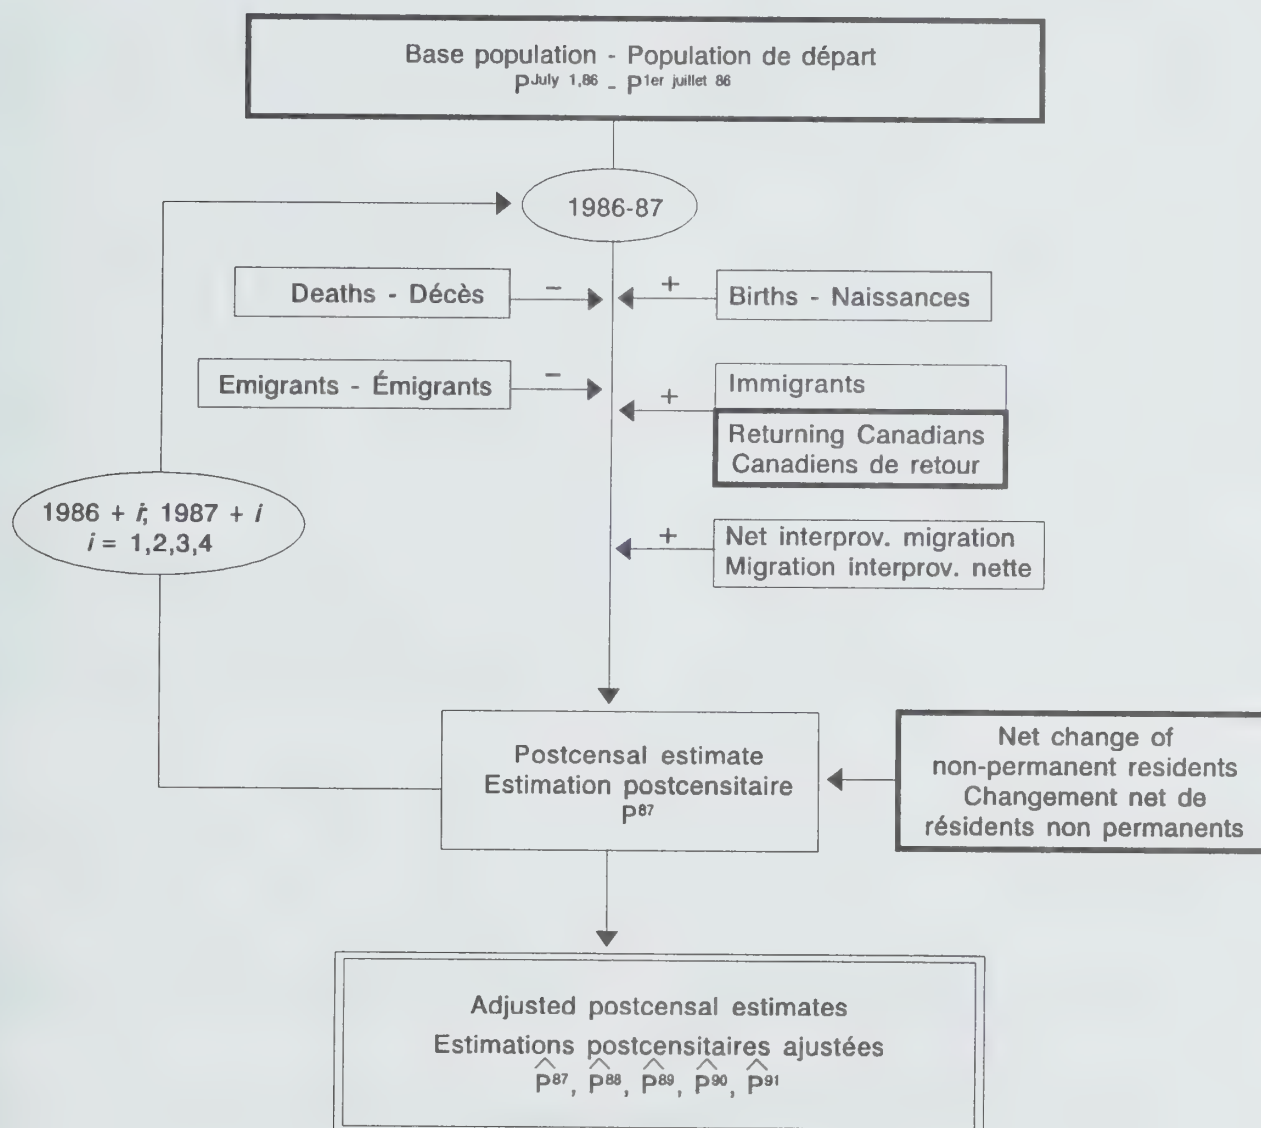

Pour la période 1971-1991, on a produit les estimations postcensitaires de la population par âge et sexe suivant la méthode des composantes. Les événements démographiques (composantes du changement de la population) qui se produisent entre le 1^{er} juillet de l'année de départ de la période postcensitaire et chaque année subséquente, sont ajoutés à la population de base ou en sont soustraits. Le diagramme 3 illustre la démarche suivie et montre que l'ajout de la composante «Canadiens de retour» a précédé la révision des estimations. En plus, on a intégré les résidents non-permanents aux estimations afin de refléter le changement de l'univers au recensement de 1991. Finalement, l'estimation annuelle des composantes a été ajustée à la date de référence portée au 1^{er} juillet.

Les paragraphes suivants décrivent la prise en compte des nouvelles composantes de l'accroissement (Canadiens de retour (CR) et résidents non permanents (RNP)) de même que les changements dans l'estimation de l'émigration.

Diagram 3. Algorithm for Calculation of Postcensal Population Estimates, 1971-1991

Diagramme 3. Algorithme pour le calcul des estimations postcensitaires de la population, 1971-1991

Example for 1986 - 1991 - L'exemple pour 1986 - 1991

Returning Canadians (CRs)

Total number of CRs

Returning Canadians are Canadian citizens who permanently emigrated in a given year and who subsequently returned to re-establish permanent residence in Canada. International geographic mobility of these persons is not included in the immigration statistics because Canadian citizens are not subject to the Immigration Act. As recent research indicates, their numbers are significant and, therefore, CRs should be taken into account as a component of population change.

There is no direct quantitative data source on the total number of Canadians returning to this country. Persons entering the country by air fill out a form E-311, administered by Customs and Excise. These movements constitute only a part of the total number of moves, but provide information on the length of stay outside Canada. This information was used in estimating the number of CRs.

It was assumed that, over a 10-year period, 50% of emigrants return to the country (Jasso and Rosenzweig, 1982). Thus, using the length-of-stay data derived from the information contained in the Customs and Excise records for 1988 to 1991, the number of CRs was calculated as follows:

$$CR_{p,t} = \frac{1}{2} \sum_{i=1}^{10,t-9} (E_{p,t} * d_i)$$

where:

$CR_{p,t}$ = number of returning Canadians in year "t" by province/territory "p";

$E_{p,t}$ = annual number of emigrants for year "t" by province/territory "p";

d_i = proportion of emigrants abroad for a duration "i" with "i" = 1; duration 0-1 year; "i" = 2; duration 1-2 years; etc. to "i" = 10;

t = 1971, 1972, ..., 1991.

Canadiens de retour (CR)

L'effectif total des CR

Les Canadiens de retour sont des citoyens canadiens qui ont émigré en permanence une année donnée, et qui sont ensuite revenus s'établir en permanence au Canada. La mobilité géographique internationale de ces personnes n'est pas comprise dans les statistiques d'immigration, car les citoyens canadiens ne sont pas soumis à la Loi sur l'immigration. Comme l'indique la recherche récente, leur nombre étant important, les Canadiens de retour devraient être pris en compte à titre de composante de l'accroissement de la population.

On ne trouve aucune source directe de données quantitatives sur les Canadiens de retour au pays. Les personnes arrivant par voie des airs remplissent le formulaire E-311, administré par Douanes et accise. Ces données ne concernent qu'une partie du mouvement, mais elles renseignent sur la durée du séjour à l'extérieur du Canada. Cette information a servi à l'estimation de l'effectif total des CR.

On présume que, sur une période de 10 ans, 50% des émigrants rentrent au pays (Jasso et Rosenzweig, 1982). Ainsi, à partir des données sur la durée du séjour obtenues des fichiers des Douanes et accise entre 1988 et 1991, on a calculé le nombre de Canadiens de retour de la manière suivante:

où:

$CR_{p,t}$ = nombre de Canadiens de retour au cours de l'année «t» selon la province ou le territoire «p»;

$E_{p,t}$ = nombre annuel d'émigrants au cours de l'année «t» selon la province ou le territoire «p»;

d_i = proportion des émigrants hors du Canada pour la durée «i», en posant que «i» = 1: durée 0-1 an; «i» = 2: durée 1-2 ans, et ainsi de suite, jusqu'à «i» = 10;

t = 1971, 1972, ..., 1991.

The annual total number of CRs at the national level corresponds to the sum of the provincial and territorial total. The emigration figures used in the estimation of CRs cover the period from 1962 to 1991.

CRs by age and sex

The annual number of CRs was distributed by age and sex using information derived from 1991 Census mobility data. The following four steps were applied:

- (1) based on the question on place of residence one year ago, the distribution by age (five-year age groups) and sex in the three subpopulations were derived:

$OUT_{a,s}^{91}$ = persons outside Canada;

$IMM_{a,s}^{90-91}$ = immigrants arriving in Canada in 1990-1991;

$NPR_{a,s}^{91}$ = non-permanent residents;

where "a" denotes age group and "s" is sex;

- (2) for each of the subpopulations, an estimate of persons aged 0 years was produced (the mobility database provides data on persons aged one year and over);
- (3) for each of the subpopulations, the distribution by age and sex was adjusted to account for net census undercoverage as measured by the coverage studies, $AOUT_{a,s}^{91}$; $AIMM_{a,s}^{90-91}$; $ANPR_{a,s}^{91}$; respectively;
- (4) the estimate of CRs by age and sex ($CR_{a,s}^{91}$) was calculated as:

$$CR_{a,s}^{91} = AOUT_{a,s}^{91} - AIMM_{a,s}^{90-91} - ANPR_{a,s}^{91}$$

The distribution based on the above estimate was assumed to be constant over the 1971-1991 period.

L'effectif annuel total de Canadiens de retour à l'échelle nationale correspond à la somme des effectifs des provinces et territoires. Les données sur l'émigration utilisées dans l'estimation des Canadiens de retour touchent la période 1962 à 1991.

Les CR selon l'âge et le sexe

Les nombres annuels de Canadiens de retour ont été ventilés selon l'âge et le sexe à partir de l'information disponible sur la mobilité au recensement de 1991 en quatre étapes :

- (1) on a dérivé de la question sur le lieu de résidence il y a un an, la distribution par âge (groupes d'âge quinquennaux) et sexe de trois sous-populations:

$OUT_{a,s}^{91}$ = personnes à l'extérieur du Canada;

$IMM_{a,s}^{90-91}$ = immigrants qui sont arrivés au Canada en 1990-1991;

$NPR_{a,s}^{91}$ = résidents non permanents;

où «a» indique un groupe d'âge et «s» indique le sexe;

- (2) pour chacune des sous-populations, on a estimé le nombre des 0 an (la base de données n'offrant des informations que sur les personnes âgées d'un an et plus);
- (3) on a ajusté chacune des sous-populations ventilées par âge et sexe pour tenir compte du sous-dénombrement net mesuré par les études de couverture, $AOUT_{a,s}^{91}$; $AIMM_{a,s}^{90-91}$; $ANPR_{a,s}^{91}$ respectivement;
- (4) on a estimé l'effectif des Canadiens de retour selon l'âge et le sexe ($CR_{a,s}^{91}$) comme suit:

On présume constante sur toute la période 1971-1991, la distribution reposant sur l'estimation ci-haut.

Non-permanent residents (NPRs)

Methods developed to produce these estimates are described in the previous section of this publication. As demonstrated in Diagram 3, for each postcensal year, after modifying the base population for the components of population change, the change between stocks of NPRs at July 1 of two consecutive years was incorporated.

The expansion of the 1991 Census universe to include NPRs resulted from the increasing size of this group in Canada over the last 20 years, implying their growing importance as consumers as well as producers of goods and services in Canada. Their presence in Canada prior to 1991 was acknowledged through incorporation of the estimates of NPRs into the revised population estimates, providing a consistent historical series of population estimates available from Statistics Canada.

Emigrants

Provincial/territorial number of emigrants

There is no a direct source of emigration data. Therefore, the total number of emigrants for Canada was derived based on the following sources:

- from 1971 to 1976 - residual method (Statistics Canada, March 1987);
- from 1976 to 1981 - family allowance data;
- from 1981 to 1991 - statistics on landed immigrants to the USA whose country of last permanent residence was Canada provided by the United States Department of Justice, Immigration and Naturalization Service, as well as the family allowance data file (change of address to outside the country) for those aged 0 to 17 years.

Additionally, for the 1981 to 1991 period, the factor f_c with a constant value of 1.1 (ratio between emigration of children aged 0 to 17 years and adults 18 years of age and over weighted by the size of these subpopulations) was used to estimate the number of adults emigrating to a country other than the United States.

Résidents non permanents (RNP)

Les méthodes développées pour estimer les RNP sont décrites dans la section précédente de cette publication. Comme indiqué au diagramme 3, pour chaque année postcensitaire, et après avoir pris en compte la croissance due à chaque composante démographique, on a incorporé le changement observé dans les stocks de RNP entre deux 1^{er} juillet consécutifs.

La décision d'inclure dans l'univers du recensement de 1991 les résidents non permanents fait suite à l'augmentation numérique de ce groupe au cours des 20 dernières années. Celle-ci se répercute sur la consommation aussi bien que sur la production de biens et services au Canada. On a reconnu la présence des RNP au Canada avant 1991 en les incluant dans la révision des estimations, procurant ainsi à l'utilisateur une série historique cohérente des estimations de population produites par Statistique Canada.

Émigrants

Effectifs d'émigrants dans les provinces et territoires

Il n'existe pas de source directe de données sur l'émigration. On a estimé les effectifs totaux des émigrants du Canada à l'aide de méthodes fondées sur diverses sources :

- de 1971 à 1976: méthode résiduelle (Statistique Canada, mars 1987);
- de 1976 à 1981: fichier des allocations familiales;
- de 1981 à 1991: le fichier des personnes qui immigrèrent aux États-Unis en provenance du Canada, fourni par le "United States Department of Justice, Immigration and Naturalization Service", de même que celui des allocations familiales (changements d'adresse vers l'extérieur du pays) pour les 0-17 ans.

De plus, pour la période 1981 à 1991, on utilise un facteur f_c évalué à 1,1 (le rapport entre l'émigration des enfants de 0 à 17 ans et les adultes de 18 ans et plus, pondéré pour la taille de ces sous-populations) pour estimer le nombre d'adultes émigrant vers un pays autre que les États-Unis.

Provincial/territorial distribution of emigrants

For the 1971 to 1981 period, the annual number of emigrants was distributed by province and territory as follows:

$$E_{j,t} = r * \frac{P_{j,t}}{P_{c,t}} * E_{c,t}$$

and

$$r = \frac{1}{2} \sum_u \frac{E_{j,u} / E_{c,u}}{P_{j,u} / P_{c,u}}$$

where:

- $E_{c,t}$ = total emigrants in year "t" for Canada;
 $E_{j,t}$ = total emigrants for province/territory "j" in year "t";
 $P_{j,t}$ = population of province/territory "j" in year "t";
 $P_{c,t}$ = population of Canada in year "t";
 u = 1981-1982 and 1982-1983;
 t = 1971-1972 to 1980-1981.

For the 1981 to 1991 period, the distribution of emigrants by province and territory corresponds to the distribution provided by family allowance data. As data on emigrants and children in Ontario were not available from 1982 to 1989, these were estimated using data from the post-1990 period.

Emigrants by age and sex

Two data sources were used to redistribute the annual provincial/territorial estimates of emigrants by age and sex: data on immigrants to the United States from Canada, and data on emigrants from Canada based on Revenue Canada tax files. The distribution in the 1971 to 1976 period is based exclusively on the first source,

Distribution des émigrants selon la province ou le territoire

Pour la période 1971-1981, le nombre annuel d'émigrants a été distribué selon les provinces et territoires de la manière suivante:

et

où:

- $E_{c,t}$ = effectif total des émigrants au cours de l'année «t» pour le Canada;
 $E_{j,t}$ = effectif total des émigrants de la province ou du territoire «j» au cours de l'année «t»;
 $P_{j,t}$ = population de la province ou du territoire «j» au cours de l'année «t»;
 $P_{c,t}$ = population du Canada au cours de l'année «t»;
 u = 1981-1982 et 1982-1983;
 t = 1971-1972 à 1980-1981.

Pour la période 1981 à 1991, la distribution des émigrants selon les provinces et territoires correspond à la distribution fournie par les données des fichiers de l'allocation familiale. Les données sur les émigrants et les enfants en Ontario n'étaient pas disponibles au cours des années 1982 à 1989. On les a donc estimées à partir des données postérieures à l'année 1990.

Émigrants selon l'âge et le sexe

On a eu recours à deux sources de données pour redistribuer les estimations annuelles par province et territoire selon l'âge et le sexe: les données sur les émigrants canadiens aux États-Unis et les données sur les émigrants canadiens fournie par les fichiers de Revenu Canada. La distribution pour la période 1971-1976 repose uniquement

while the post-1976 period distribution is derived from both.

III. Calculation of the revised intercensal estimates by age and sex

After the postcensal estimates were produced for all quinquennial periods (1971 to 1976; 1977 to 1981; 1982 to 1986 and 1987 to 1991), the estimates for the last year of each period (1976, 1981, 1986 and 1991) were compared with the base population of the next period (census population counts by age, sex and province/territory adjusted to July 1 and for net under-coverage and including non-permanent residents). The resulting difference is referred to as the error of closure (Text Table XI), which was used to calculate the revised intercensal estimates.

The revised intercensal population estimates were calculated as follows:

within each quinquennial period, for each age and sex

- the error of closure was distributed linearly over a quinquennial period with respect to a particular age cohort;
- the postcensal estimates were augmented by the above estimate of error of closure (Statistics Canada, March 1987).

IV. Derivation of the intercensal population estimates by age, sex and marital status

Intercensal provincial/territorial population estimates by age, sex and marital status were produced in three steps:

for each age and sex

- (1) calculation of the marital status proportions for the 1971 to 1991 Censuses;
- (2) interpolation of the marital status proportions calculated in (1) for years between censuses;
- (3) application of the proportions obtained in (2) to the revised intercensal population estimates.

sur la première source, alors que la distribution pour la période postérieure à 1976 combine les deux.

III. Calcul des estimations intercensitaires révisées selon l'âge et le sexe

Après avoir produit les estimations post-censitaires pour l'ensemble des périodes quinquennales (1971 à 1976; 1977 à 1981; 1982 à 1986; 1987 à 1991), les estimations de la dernière année de chacune de ces périodes (1976, 1981, 1986, et 1991) sont comparées à la population de départ de la période suivante (soit la population recensée selon l'âge, le sexe et la province ou le territoire, ajustée au 1^{er} juillet, corrigée du sous-dénombrement net et comprenant les résidents non permanents). La différence qui résulte de la comparaison est nommée erreur en fin de période (tableau explicatif XI), et est utilisée pour calculer les estimations intercensitaires révisées.

Les estimations intercensitaires révisées ont été calculées comme suit:

pour chaque période quinquennale, chaque âge et chaque sexe

- l'erreur en fin de période a été distribuée de façon linéaire au cours d'une période quinquennale, sur la base d'une cohorte de naissance;
- l'erreur en fin de période ainsi distribuée a été ajoutée aux estimations postcensitaires (Statistique Canada, mars 1987).

IV. Production des estimations intercensitaires de la population selon l'âge, le sexe et l'état matrimonial

Les estimations intercensitaires par province et territoire selon l'âge, le sexe et l'état matrimonial ont été obtenues en trois étapes:

pour chacun des âges et sexes

- (1) calcul des distributions relatives selon l'état matrimonial aux recensements de 1971 à 1991;
- (2) interpolation des proportions calculées en (1) entre les recensements;
- (3) application des proportions obtenues en (2) aux estimations intercensitaires révisées.

Distribution by marital status in the census

Using census counts of population adjusted for net undercoverage and non-permanent residents, the proportional distribution by marital status is calculated for each census for each sex and age, by province/territory, as follows:

$$k_T^{ms} = P_T^{ms} / P_T$$

where:

k_T^{ms} = proportion of the population in marital status "ms" in census "T";

P_T^{ms} = the adjusted number of persons in marital status "ms" in census "T";

P_T = the adjusted number of persons in census "T";

ms = marital status: single, married (including separated and common law), widowed, divorced;

T = 1971, 1976, 1981, 1986 and 1991.

Marital status proportions for intercensal years

The proportional distribution for each intercensal year is estimated by equally distributing for each age by sex the difference between the proportions from two consecutive censuses (T1 and T2). Thus:

$$k_{T1+i}^{ms} = k_{T1}^{ms} + \frac{i}{5} (k_{T2}^{ms} - k_{T1}^{ms})$$

where:

k_{T1+i}^{ms} = proportion of the population of marital status "ms" intercensal year "T1+i";

$k_{T1}^{ms} (k_{T2}^{ms})$ = proportion of the population of marital status "ms" census "T1" ("T2");

Répartitions selon l'état matrimonial au recensement

À l'aide des populations recensées ajustées pour le sous-dénombrement net et pour le nombre de résidents non permanents, la distribution relative par état matrimonial a été calculée pour chacun des âges et sexes, par province et territoire, comme suit:

où:

k_T^{ms} = proportion de la population d'état matrimonial «ms» lors du recensement «T»;

P_T^{ms} = effectif d'état matrimonial «ms» au recensement «T» ajusté;

P_T = effectif recensé en «T» ajusté;

ms = état matrimonial: célibataire, marié (y compris les personnes séparées ou vivant en union consensuelle), veuf ou divorcé;

T = 1971, 1976, 1981, 1986 et 1991.

Répartition par l'état matrimonial, années intercensitaires

La distribution relative pour chacune des années intercensitaires est estimée en répartissant également, pour chaque âge et par sexe, la différence entre les proportions tirées de deux recensements consécutifs (T1 et T2). Ainsi :

où:

k_{T1+i}^{ms} = proportion de la population selon l'état matrimonial «ms», année intercensitaire «T1+i»;

$k_{T1}^{ms} (k_{T2}^{ms})$ = proportion de la population selon l'état matrimonial «ms» au recensement «T1» («T2»);

$i = 1,2,3,4.$

$i = 1,2,3,4.$

Intercensal estimates by age, sex and marital status

Estimations intercensitaires selon l'âge, le sexe et l'état matrimonial

For each province and territory separately, in a given age and sex, the intercensal estimates by age and sex are multiplied by the proportions estimated in the previous step in order to obtain the estimates by age, sex and marital status.

Par province et territoire, pour un âge et un sexe donnés, on multiplie les estimations intercensitaires par les proportions estimées au cours de l'étape précédente pour obtenir les estimations par âge, sexe et état matrimonial.

• **Census Divisions and Census Metropolitan Areas**

• **Divisions et régions métropolitaines de recensement**

I. The July 1, 1986 and 1991 Estimates

I. Estimations au 1^{er} juillet 1986 et 1991

These estimates are based on the 1986 and 1991 Census populations. The first step performed was to adjust the data for net census undercoverage. In order to make this adjustment, the net undercoverage rates by age group and sex for each province and territory were recalculated by subtracting from the net number of unenumerated persons, an estimate of the number of persons living on incompletely enumerated Indian reserves and settlements (Lebrasseur, 1992), (Text Table VI) using the following equation:

Ces estimations ont comme point de départ la population énumérée aux recensements de 1986 et 1991. Dans une première étape, on a ajusté ces effectifs pour le sous-dénombrement net. Pour effectuer cet ajustement, on a recalculé les taux de sous-dénombrement net par groupe d'âge et de sexe de chaque province et territoire en soustrayant du nombre net de personnes non-énumérées, une estimation de l'effectif non recensé des réserves et des établissements indiens partiellement énumérés (Lebrasseur, 1992) qui figurent au tableau explicatif VI, à l'aide de l'équation suivante:

$$TNU_{(a,a+5)} = \frac{NU_{(a,a+5)} - INE_{(a,a+5)}}{P_{(a,a+5)} + [NU_{(a,a+5)} - INE_{(a,a+5)}]}$$

where:

où:

TNU = net census undercoverage rate excluding Indians;

TNU = taux de sous-dénombrement net excluant les Indiens;

NU = net number of unenumerated persons according to the 1991 Census coverage studies and estimate for 1986;

NU = nombre net de personnes non énumérées calculé par les études de couverture du recensement de 1991 et estimé pour 1986;

INE = estimates of unenumerated persons living on incompletely enumerated Indian reserves;

INE = estimations des personnes non énumérées vivant sur des réserves partiellement énumérées;

a = age;

a = âge;

P = persons enumerated in June 1986 or 1991;

P = personnes recensées en juin 1986 ou 1991;

Text Table VII provides net undercoverage rates of total population for each province excluding unenumerated persons living on incompletely enumerated Indian reserves.

The June 1986 and 1991 population corrected for net census undercoverage (\hat{P}) for a CD (i), was obtained by using the rates calculated above in the following equation:

$$\hat{P}_{i(a,a+5)} = \frac{P_{i(a,a+5)}}{(1 - TNU_{(a,a+5)})}$$

In the second step, to those census divisions and census metropolitan areas which contained incompletely enumerated Indian reserves, we added the estimate of the number of Indians not enumerated in the 1986 and 1991 Censuses. Finally, the total population on July 1, 1986 and 1991 (\hat{P}) for each census division (i) was obtained by applying the following equation:

$$\hat{P}'_i = \sum_1^{16} \hat{P}_{i(a,a+5)} + INE_{i(a,a+5)} \cdot \frac{\hat{P}'_{j,91}}{\hat{P}_{j,91}}$$

where:

\hat{P}'_i = population on July 1, 1986 and 1991, census division "i";

\hat{P}'_j = population on July 1, 1986 and 1991, province "j";

\hat{P}_j = population adjusted for net census undercoverage as of June 1, 1986 and 1991, province "j";

II. Postcensal Estimates, July 1, 1987 to 1991

In order to estimate the population of census divisions and census metropolitan areas using the component method, the July 1, 1986 base population was used and to which, as the following equation shows, the components of population growth were added:

$$\hat{P}_{i(t+1)} = \hat{P}_{i(t)} [B_{i(t,t+1)} - D_{i(t,t+1)} + I_{i(t,t+1)} - E_{i(t,t+1)} + NPR_{i(t,t+1)} + CR_{i(t,t+1)} + N_{i(t,t+1)}]$$

Le tableau explicatif VII fournit les taux de sous-dénombrement net de la population totale de chaque province excluant les personnes non énumérées vivant sur des réserves indiennes partiellement énumérées.

La population en juin 1986 et 1991 corrigée pour le sous-dénombrement net (\hat{P}) pour une DR (i) s'obtient donc en utilisant les taux calculés ci-dessus à l'aide de l'équation suivante:

Dans une seconde étape, pour les divisions et régions métropolitaines de recensement où l'on retrouve des réserves indiennes partiellement énumérées, on a ajouté l'estimation des effectifs indiens non énumérés (INE) aux recensements de 1986 et 1991. Enfin la population totale au 1^{er} juillet 1986 et 1991 (\hat{P}) pour chaque division de recensement (i) est obtenue en appliquant l'équation suivante:

où:

\hat{P}'_i = population au 1^{er} juillet, 1986 et 1991, division de recensement «i»;

\hat{P}'_j = population au 1^{er} juillet, 1986 et 1991, province «j»;

\hat{P}_j = population ajustée pour le sous-dénombrement net au 1^{er} juin 1986 et 1991, province «j»;

II. Estimations postcensitaires, 1^{er} juillet, 1987 à 1991

Pour estimer la population des divisions et régions métropolitaines de recensement selon la méthode des composantes, on utilise la population de base au 1^{er} juillet 1986 à laquelle on ajoute les composantes de l'accroissement démographique, comme l'indique l'équation suivante:

where:

$\hat{P}_{i(t+1)}$ = estimate of the population on July 1, year t+1;

P'_i = estimate of the population on July 1, year "t";

B = number of births between July 1, year "t" and June 30, year t+1;

CR = returning Canadians between July 1, year "t" and June 30, year t+1;

D = number of deaths between July 1, year "t" and June 30, year t+1;

I = number of immigrants between July 1, year "t" and June 30, year t+1;

E = number of emigrants between July 1, year "t" and June 30, year t+1;

NPR = the net change of non-permanent residents between July 1, year "t" and June 30, year t+1;

N = net internal migration between July 1, year "t" and June 30, year t+1;

t,t+1 = interval between July 1, year "t" and June 30, year t+1;

i = census division or census metropolitan area.

As components were available only for a year ending May 31, these were estimated for the year ending on June 30 in the following manner:

$$E'_{ij} = E_{ij(t,t+1)} \cdot \frac{E'_{j(t,t+1)}}{E_{j(t,t+1)}}$$

where:

E'_{ij} = demographic events observed between July 1, year "t", and June 30, year t+1, census division "i" in province "j";

où:

$\hat{P}_{i(t+1)}$ = estimation de la population au 1^{er} juillet, année t+1;

P'_i = estimation de la population au 1^{er} juillet, année «t»;

B = nombre de naissances entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

CR = Canadiens de retour entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

D = nombre de décès entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

I = nombre d'immigrants entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

E = nombre d'émigrants entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

NPR = solde des résidents non permanents entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

N = migration interne nette entre le 1^{er} juillet, année «t» et le 30 juin, année t+1;

t,t+1 = intervalle entre le 1^{er} juillet de l'année «t» et le 30 juin de l'année t+1;

i = division ou région métropolitaines de recensement.

Ne disposant des composantes que pour une année se terminant le 31 mai, on a estimé celles-ci pour une année se terminant le 30 juin de la façon suivante:

où:

E'_{ij} = événements démographiques survenus entre le 1^{er} juillet, année «t», et le 30 juin, année t+1, division de recensement «i» dans la province «j»;

E_{ij} = demographic events observed between June 1, year "t", and May 31, year t+1, census division "i" in province "j";

E'_j = demographic events observed between July 1, year "t", and June 30, year t+1, in province "j";

E_j = demographic events observed between June 1, year "t", and May 31, year t+1, in province "j".

For each component, the sum of events for all the census divisions in a given province is equal to the total of the corresponding event for the province. Thus, the population estimates per CDs derived using these components correspond to the provincial population estimates.

Since components based on 1991 boundaries were not available for CDs in Quebec and for three in British Columbia, they were estimated using conversion factors (FC_k) in the following manner:

1. 1986 and 1991 CDs were decomposed into their constituent census subdivision (CSD) parts;
2. Calculation of the conversion factors (FC_k) is as follows:

$$FC_k = \frac{P_k^{91}}{P_{i,B86}^{91}}$$

where:

FC_k = adjustment factor for the kth CSD;

P_k^{91} = 1991 census population of the kth CSD;

$P_{i,B86}^{91}$ = 1991 census population of the CD in which the CSD was located according to 1986 boundaries.

E_{ij} = événements démographiques survenus entre le 1^{er} juin, année «t», et le 31 mai, année t+1, division de recensement «i» dans la province «j»;

E'_j = événements démographiques survenus entre le 1^{er} juillet, année «t», et le 30 juin, année t+1, dans la province «j»;

E_j = événements démographiques survenus entre le 1^{er} juin, année «t», et le 31 mai, année t+1, dans la province «j».

Pour chaque composante, la somme des événements par division de recensement d'une province donnée est égale au nombre total correspondant d'événements de la province. La somme des estimations démographiques des DR résultant de l'utilisation de ces composantes correspond donc à l'estimation démographique provinciale.

Les composantes selon les limites de 1991 n'étant pas disponibles pour les divisions de recensement du Québec et pour trois de la Colombie-Britannique, nous les avons estimées à l'aide de facteurs de conversion (FC_k) selon les étapes suivantes:

1. Identification des subdivisions de recensement (SDR) à l'intérieur des DR de 1986 et 1991;
2. Calcul des facteurs de conversion (FC_k) selon l'équation suivante:

où:

FC_k = facteur de conversion pour la SDR (k);

P_k^{91} = population recensée en 1991 dans la SDR (k);

$P_{i,B86}^{91}$ = population recensée en 1991 dans la DR i selon les limites de 1986 où se trouvait cette SDR.

3. This ratio was then applied to the 1986 boundary component counts at the CD level to produce a CSD-based component count indicated in the following equation:

$$E'_k = FC_k \cdot E_{i,B86}$$

where:

E'_k = CSD-based component count;

E_i = CD-based component count according to 1986 boundaries.

4. The CSD-based component counts were then summed to their 1991 boundary CDs to yield CD level estimates.

III. Revised Intercensal Estimates, July 1, 1986 to 1991

The production of intercensal estimates of total population involves two steps: the calculation of the error of closure and the distribution of this error among the estimates.

The error of closure comes from basically two sources: adjustment for net undercoverage in successive censuses; and errors in the components of population change over the intercensal period. It is, however, impossible to decompose the error into census and component portions by any empirical means. The assumption is made that the total error of closure is a linear function of the time elapsed since the last census.

Total population estimates for the intercensal years are then obtained by the following formulae:

$$\begin{aligned} P_{(t-4)} &= \hat{P}_{(t-4)} - \frac{1}{5} \varepsilon \\ P_{(t-3)} &= \hat{P}_{(t-3)} - \frac{2}{5} \varepsilon \\ &\vdots \\ P_{(t)} &= \hat{P}_{(t)} - \frac{5}{5} \varepsilon \end{aligned}$$

3. On a appliqué ce facteur à chaque composante de la division de recensement selon les limites de 1986 de façon à obtenir les composantes au niveau de chaque SDR tel qu'indiqué dans l'équation suivante:

où:

E'_k = composante E pour la SDR k;

E_i = composante E pour une DR selon les limites de 1986.

4. En sommant les composantes des SDR faisant partie de la DR selon les limites de 1991, on obtient les composantes pour chaque DR.

III. Estimations intercensitaires révisées, 1^{er} juillet 1986 à 1991

La production des estimations intercensitaires se fait en deux étapes: on estime tout d'abord l'erreur en fin de période puis on la répartit par année.

Vu l'impossibilité de distinguer la part de l'erreur en fin de période qui provient de l'ajustement pour le sous-dénombrement net aux deux recensements successifs, de celle due à l'estimation incorrecte des composantes, nous posons l'hypothèse que l'erreur en fin de période s'accroît de façon linéaire tout au long de la période intercensitaire.

Les estimations de la population totale pour les années intercensitaires sont obtenues par les formules suivantes:

where:

 $P_{(t-4)}$ = intercensal population estimate for year t-4; $\hat{P}_{(t-4)}$ = postcensal population estimate for the year t-4; ε = error of closure; t = the most recent census year.

où:

 $P_{(t-4)}$ = estimation intercensitaire de la population pour l'année t-4; $\hat{P}_{(t-4)}$ = estimation postcensitaire de la population pour l'année t-4; ε = erreur en fin de période; t = année du dernier recensement.**Census Metropolitan Areas**

The population estimates for CMAs are derived by converting the estimates for the census divisions of the corresponding year. The equation takes the following form:

$$\hat{P}_{t+1}^{cm} = \frac{P_t^{cm}}{\sum_{cd} P_t^{cd}} \cdot \sum_{cd} P_{t+1}^{cd}$$

where:

 \hat{P}_{t+1}^{cm} = estimate of the population for the CMA, year t+1; P_t^{cm} = population (estimated) for the CMA, year "t"; P_{t+1}^{cd} = estimate in year t+1 of the population for all census divisions, entirely or partially included in the CMA; and P_t^{cd} = population (estimated) in year "t" for all census divisions entirely or partially included in the CMA.

- Census Family Estimates**

Revised intercensal estimates of census families for the 1986-1991 period were produced in the following four stages:

I. Development of the base;

où:

 \hat{P}_{t+1}^{cm} = estimation de la population de la RMR pour l'année t+1; P_t^{cm} = population (estimée) de la RMR pour l'année «t»; P_{t+1}^{cd} = estimation de l'année t+1 de la population pour toute division de recensement entièrement ou partiellement comprise dans la RMR; et P_t^{cd} = population (estimée), à l'année «t», de toute division de recensement entièrement ou partiellement comprise dans la RMR.

- Estimation des familles de recensement**

Les estimations intercensitaires révisées des familles de recensement pour la période 1986-1991 ont été préparées en quatre étapes:

I. la préparation de la population de départ;

- II. Calculation of the postcensal estimates of the total number of census families for provinces and territories;
- III. Production of the intercensal estimates of the total number of census families for provinces and territories;
- IV. Derivation of the provincial intercensal census families estimates by certain family characteristics (size and type).

A general method for the production of these estimates is described in Statistics Canada, March 1987. In the following sections herein, the revisions and updates to the methods and data sources are indicated and described in a concise way.

I. Development of the base

The intercensal estimates of census families as of July 1 for the 1986 to 1991 period are based on the 1986 Census counts of census families for provinces and territories corrected:

- (1) to obtain census family counts as of July 1, 1986 (using proportional allocation of the growth in the number of census families observed between the 1981 and 1986 and the 1986 and 1991 Censuses);
- (2) to incorporate the estimate of families of non-permanent residents (this estimate was added to the July 1, 1986 counts of families derived in the previous step).

II. Postcensal estimates of the total provincial/territorial number of census families

The total number of provincial/territorial families was obtained by the component method which is outlined in Diagram 4. The events responsible for the formation and dissolution of families which occurred between July 1, 1986 and the reference period of the estimates are added to or subtracted from the 1986 base. The following three types of events are accounted for:

- II. le calcul des estimations postcensitaires du nombre total de familles de recensement dans les provinces et territoires;
- III. la production d'estimations intercensitaires du nombre total de familles de recensement dans les provinces et territoires;
- IV. la ventilation des estimations intercensitaires des familles de recensement selon certaines caractéristiques (taille et structure).

La méthode générale de production de ces estimations est présentée dans Statistique Canada, mars 1987. Dans les sections qui suivent, les révisions et mises à jour des méthodes et des sources de données sont brièvement présentées.

I. La préparation de la population de base

Les estimations intercensitaires des familles de recensement au 1^{er} juillet pour la période 1986-1991 sont basées sur le nombre de familles de recensement au recensement de 1986 dans les provinces et territoires, corrigé:

- (1) pour obtenir les effectifs des familles de recensement au 1^{er} juillet, 1986 (en utilisant la répartition proportionnelle de l'accroissement dans le nombre de familles de recensement observées entre les recensement de 1981 et 1986, et entre les recensements de 1986 et 1991);
- (2) pour incorporer l'estimation des familles de résidents non permanents (cette estimation a été ajoutée aux effectifs des familles au 1^{er} juillet 1986 obtenus à l'étape précédente).

II. Estimations postcensitaires de l'effectif total des familles de recensement selon la province ou le territoire

L'effectif total des familles de recensement selon la province ou le territoire a été obtenu par la méthode des composantes, présentée au diagramme 4. Les événements responsables de la formation et de la dissolution des familles, qui se sont produits entre le 1^{er} juillet 1986 et la période de référence des estimations, sont ajoutés ou soustraits de la population de départ de 1986. On tient compte des trois types d'événements suivants:

- (1) events contributing to an increase in the number of families (formation of new families resulting from marriages, families immigrating from another country and families of Canadian citizens and permanent residents returning to Canada to re-establish permanent residence);
- (2) events resulting in a decrease in the number of families (dissolution of families due to: divorces of couples without children, deaths of married persons, deaths of widowed persons, deaths of divorced persons and families emigrating to another country);
- (3) events triggering net change in the number of families (net interprovincial migration of families, net change in non-permanent resident families and net change in common-law unions).

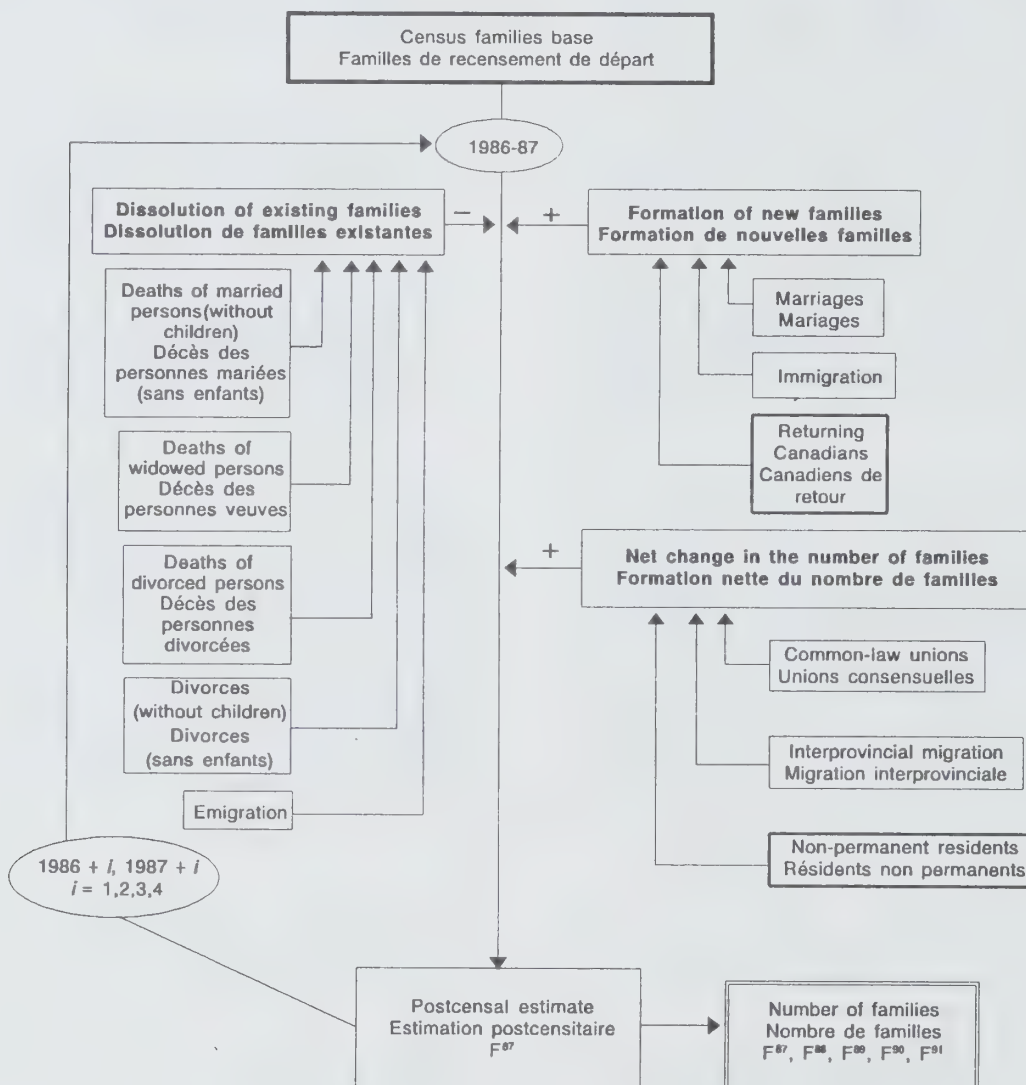

As indicated in Diagram 4 (elements delineated in bold), revisions to the estimation procedure encompass: a change to the reference date of the estimates (from June 1 to July 1); an enhancement of the international in-flows of families of returning Canadians (CRs); and accounting for change in the number of families of non-permanent residents (NPRs). A brief description of the approach used to estimate these new components, as well as net change in the number of common-law unions, follows.

- (1) les événements contribuant à l'accroissement du nombre des familles (formation de nouvelles familles par mariage, familles immigrant d'un autre pays et familles d'émigrés canadiens et de résidents permanents de retour au Canada, en vue de s'y rétablir en permanence);
- (2) les événements causant une diminution du nombre de familles (dissolution des familles à cause de divorces de couples sans enfants, de décès de personnes mariées, de décès de veufs ou de veuves, de décès de personnes divorcées et émigration des familles vers un autre pays);
- (3) les événements causant un changement dans le solde des familles (solde migratoire interprovincial des familles, solde des familles de résidents non permanents et solde des unions consensuelles).

Tel qu'indiqué au diagramme 4 (éléments inscrits en caractères gras), les révisions des méthodes d'estimation comprennent: un changement dans la date de référence des estimations (du 1^{er} juin au 1^{er} juillet); un raffinement du calcul des entrées internationales, qui comprennent maintenant les familles des Canadiens de retour (CR); et un ajustement pour le nombre de familles de résidents non permanents (NPR). Une rapide description de la méthode utilisée pour estimer ces nouvelles composantes, de même que le nombre d'unions consensuelles, suit.

Diagram 4. Algorithm for Calculation of Postcensal Census Family Estimates, 1986-1991

Diagramme 4. Algorithme pour le calcul des estimations postcensitaires des familles de recensement, 1986-1991

Families of returning Canadians

Consistent with the approach used to estimate the number of immigrating and emigrating families, the provincial/territorial number of families of CRs was derived assuming that every married woman among CRs represents one family. Thus, the number of married women by province/territory was produced as follows:

For each year ending June 30 of the 1986 to 1991 period

- (1) calculation of the number of CR women aged 15 years and over by age, sex and province/territory;
- (2) derivation of proportions of married women among those aged 15 years and over based on the revised intercensal population estimates by age, sex and province/territory;
- (3) estimation of the number of married women among CRs by applying the proportions derived in the previous step to the numbers of CR women aged 15 years and over.

Net change of non-permanent resident families

Data for this component were derived through an estimation of the number of non-permanent resident families as of July 1 in the 1986 to 1991 period and then a calculation of the annual change in the number of these families for each year of this period. Estimates of non-permanent resident families as of July 1 were produced using the following equation:

$$CF_{p,t}^{NPR} = r_p \times MF_{p,t}^{NPR}$$

and

$$r_p = (CF_{p,91} / MFF_{p,91}) \times (MFF_{p,91}^{NPR} / MF_{p,91}^{NPR})$$

where:

Familles de Canadiens de retour

Conformément à l'approche utilisée pour estimer le nombre de familles immigrantes et émigrantes, on a estimé les familles de Canadiens de retour selon la province ou le territoire en supposant qu'à chacune des femmes mariées parmi les Canadiens de retour correspondait une famille. Ainsi, le nombre de ces femmes mariées par province ou territoire a été obtenu de la façon suivante:

Pour chaque année se terminant le 30 juin, entre 1986 et 1991

- (1) détermination du nombre de femmes âgées de 15 ans et plus parmi les Canadiens de retour selon l'âge, le sexe et la province ou le territoire;
- (2) établissement des proportions de femmes mariées parmi celles de 15 ans et plus à partir des estimations intercensitaires révisées de la population selon l'âge, le sexe, l'état matrimonial par province ou territoire;
- (3) estimation du nombre des femmes mariées parmi les Canadiens de retour en appliquant la proportion tirée de l'étape précédente aux effectifs de Canadiennes de retour de 15 ans et plus.

Solde des familles de résidents non permanents

Les effectifs de cette composante sont calculés à partir de l'estimation du nombre de familles de résidents non permanents au 1^{er} juillet, entre 1986 et 1991, auxquelles on a ajouté l'accroissement annuel du nombre de ces familles pour chacune des années de la période visée. Les estimations des familles de résidents non permanents au 1^{er} juillet ont été produites à l'aide des équations:

et

où:

$CF_{p,t}^{NPR}$	=	number of non-permanent resident census families for province/territory "p" and year "t";	$CF_{p,t}^{NPR}$	=	nombre de familles de recensement de résidents non permanents pour la province ou le territoire «p» et l'année «t»;
$MF_{p,t}^{NPR}$	=	number of non-permanent resident married females for province/territory "p" and year "t";	$MF_{p,t}^{NPR}$	=	nombre de femmes mariées parmi les résidents non permanents pour la province ou le territoire «p» et l'année «t»;
$CF_{p,91}$	=	total number of census families in the 1991 Census for province/territory "p";	$CF_{p,91}$	=	nombre total de familles de recensement au recensement de 1991 pour la province ou le territoire «p»;
$MFF_{p,91}$	=	total number of married females in census families in the 1991 Census for province/territory "p";	$MFF_{p,91}$	=	nombre total de femmes mariées dans les familles de recensement de 1991, pour la province ou le territoire «p»;
$MFF_{p,91}^{NPR}$	=	number of non-permanent resident married females in census families in the 1991 Census for province/territory "p";	$MFF_{p,91}^{NPR}$	=	nombre de femmes mariées parmi les résidents non permanents dans les familles du recensement de 1991 pour la province ou le territoire «p»;
$MF_{p,91}^{NPR}$	=	number of non-permanent resident married females in the 1991 Census for province/territory "p";	$MF_{p,91}^{NPR}$	=	nombre de femmes mariées parmi les résidents non permanents recensés en 1991, pour une province ou un territoire «p»;
t	=	1986, 1987, ..., 1991.	t	=	1986, 1987, ..., 1991.

Net change in the number of common-law families

As for the non-permanent residents' families, for each year in the 1986 to 1991 period, the net change in the number of common-law families was obtained by first estimating their total number for each province and territory as of July 1, and then the annual change in the number of these families for each year of the postcensal period. The following equations based on the 1981 and 1986 Census data (common-law unions and population by age group, sex and province/territory) and the 1986 to 1991 postcensal population estimates by age, sex and province/territory were used:

Solde des familles formées par des unions consensuelles

Comme dans le cas des familles de résidents non permanents, pour chacune des années entre 1986 et 1991, le solde des familles formées par des unions consensuelles a été obtenu en estimant d'abord le nombre total de ces unions pour chaque province et territoire au 1^{er} juillet, auquel on a ajouté l'accroissement annuel du nombre des familles pour chacune des années de la période postcensitaire. On a eu recours aux équations suivantes, basées sur les données des recensements de 1981 et 1986 (unions consensuelles et population selon le groupe d'âge, le sexe et la province ou le territoire), et sur les estimations postcensitaires selon l'âge, le sexe et la province ou le territoire pour chacune des années entre 1986 et 1991:

$$U_t = \left[\frac{U_{86}}{P_{86}} + \frac{t-1986}{5} \left[\frac{U_{86}}{P_{86}} - \frac{U_{81}}{P_{81}} \right] \right] [P_t]$$

$$\Delta U_{(t-1,t)} = U_t - U_{t-1}$$

where:

U_t = number of common-law unions as of July 1, year "t",

$U_{81}(U_{86})$ = number of common-law unions according to the 1981 (1986) Census;

P_t = postcensal estimate of population as of July 1, year "t",

$P_{81}(P_{86})$ = population count according to the 1981 (1986) Census,

$\Delta U_{t-1,t}$ = net change in common-law unions for the (t-1,t) period,

t = 1986, 1987, ..., 1991.

où:

U_t = nombre d'unions consensuelles au 1^{er} juillet de l'année «t»;

$U_{81}(U_{86})$ = nombre d'unions consensuelles selon le recensement de 1981 (1986);

P_t = estimation postcensitaire de la population au 1^{er} juillet, au cours de l'année «t»;

$P_{81}(P_{86})$ = effectif de la population recensée en 1981 (1986);

$\Delta U_{t-1,t}$ = solde des unions consensuelles pour la période (t-1,t);

t = 1986, 1987, ..., 1991.

III. Intercensal estimates of provincial/territorial number of census families

The postcensal estimates as of July 1, 1991 were compared with the 1991 Census counts of census families by province and territory adjusted to July 1. This adjustment was done by proportionately allocating the growth in the number of census families registered between the 1986 and 1991 Censuses. The difference resulting from this comparison is referred to as the error of closure (Text Table XIII), and was used to calculate the revised intercensal estimates as follows:

For each province and territory

- the provincial/territorial error of closure was distributed linearly over a quinquennial period;
- the postcensal estimates were augmented by the above estimate of error of closure (Statistics Canada, March 1987).

III. Estimations intercensitaires du nombre de familles de recensement selon la province ou le territoire

On a comparé les estimations postcensitaires au 1^{er} juillet 1991 aux effectifs des familles du recensement de 1991 selon la province ou le territoire, ajustés au 1^{er} juillet. On utilise pour cet ajustement une distribution proportionnelle de l'accroissement du nombre de familles observé entre les recensements de 1986 et 1991. La différence entre les effectifs comparés est appelée erreur en fin de période (tableau explicatif XIII), et sert à calculer les estimations intercensitaires révisées de la façon suivante:

Pour chaque province et territoire:

- extrapolation linéaire de l'erreur en fin de période pour chaque province et territoire sur une période de cinq ans;
- ajout de l'estimation sus-mentionnée de l'erreur en fin de période aux estimations postcensitaires (Statistique Canada, mars 1987).

IV. Intercensal estimates of census families by characteristics

Intercensal estimates of the total number of families by province and territory were derived by family type (husband-wife and lone-parent families), size of family (2, 3, 4, 5 and 6 or more members), age of child(ren) and age of parent(s) (for families headed by one parent, by sex of parent) were produced. The estimation procedure was based on trends in the family characteristics as reflected in years between the 1986 and 1991 Censuses. The following four steps were taken:

For each province:

- (1) calculation of the proportions of families by characteristics based on 1986 and 1991 Census data;
- (2) interpolation between proportions obtained in (1) for each year in the 1986 to 1991 period and adjustment for extrapolated proportions with negative values;
- (3) application of extrapolated proportions to the intercensal estimates of the total number of families;
- (4) estimation of the number of persons in families by characteristics (Statistics Canada, March 1987).

IV. Estimations intercensitaires des familles de recensement selon diverses caractéristiques

On a ventilé les estimations intercensitaires du nombre total de familles selon la province ou le territoire selon les caractéristiques de la famille (famille époux-épouse ou famille monoparentale), taille de la famille (2,3,4,5,6 membres ou plus), âge des enfants et âge du parent ou des parents (dans le cas des familles monoparentales, on mentionne aussi le sexe du parent). La méthode d'estimation est basée sur l'évolution observée des caractéristiques des familles entre les recensements de 1986 et 1991. On est passé par les étapes suivantes:

Pour chaque province:

- (1) calcul des distributions des familles selon les caractéristiques retenues, à partir des données des recensements de 1981 et 1986;
- (2) interpolation entre proportions trouvées à l'étape (1) pour obtenir les distributions annuelles intercensitaires, et ajustement pour les proportions extrapolées de valeur négative;
- (3) application des proportions extrapolées aux estimations intercensitaires au nombre total de familles;
- (4) obtention de l'estimation du nombre de personnes dans les familles selon les caractéristiques retenues (Statistique Canada, mars 1987).

QUALITY OF DEMOGRAPHIC DATA

Postcensal and intercensal population and census family estimates are subject to error which originates from the following sources: census data, component data and methods.

Census Data

- *Coverage, Response and Imputation Errors*

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of error are intrinsic to any survey data.

During the process of developing the bases for estimates, an attempt was made to correct only for coverage errors in the population bases. This correction, however, as it is based on the results of the coverage studies and on modelling of provincial overcoverage and territorial net undercoverage prior to 1991 as well as by age, sex and marital status, is also subject to sampling, collection, response and processing errors and uncertainty in the assumptions underlying the models. With respect to the coverage studies, statistical analysis concluded that the adjustment, although not without errors itself, improves the quality of census data (Royce, 1993). The selection of the particular modelling assumption was based on the analysis of a simulation of several feasible approaches (Dick, 1992; Michalowski, 1993b). They are deemed to be consistent over time and across geographical areas, and to provide logical results. Errors associated with these assumptions are, however, very difficult to quantify at this stage of population estimates production.

LA QUALITÉ DES DONNÉES DÉMOGRAPHIQUES

Les estimations postcensitaires et intercensitaires de population et des familles de recensement, sont sujettes à des erreurs qui proviennent des données du recensement, de celles sur les composantes et des méthodes.

Données tirées des recensements

- *Erreurs de couverture, de réponse et de traitement*

On distingue deux groupes d'erreurs attribuables aux données de recensement : les unes touchent les réponses et le traitement, les autres, la couverture. Le premier groupe comprend l'absence de réponse, l'interprétation erronée des questions, le codage des réponses et l'imputation des non réponses. Le second groupe inclut le sous-dénombrement et le surdénombrement. Ces deux types d'erreur sont inhérents à n'importe quelle enquête.

Lors de l'élaboration des populations de base, on a tenté de corriger les erreurs de couverture seulement. Toutefois cette correction, basée sur les résultats des études de couverture et sur la modélisation du surdénombrement des provinces et territoires par âge, sexe et état matrimonial, est elle-même sujette aux erreurs d'échantillonnage, de collecte, de réponse et de traitement de même qu'à la fragilité des hypothèses qui sous-tendent les modèles élaborés. En ce qui concerne les études de couverture, les tests statistiques indiquent que l'ajustement, quoique non exempt d'erreur en soi, améliore la qualité des données du recensement (Royce, 1993). Le choix des hypothèses à la base des modèles est fondé sur l'analyse de la simulation de plusieurs approches possibles (Dick, 1992, Michalowski, 1993b). Les hypothèses sélectionnées ont l'avantage d'être cohérentes dans le temps et par région géographique, ainsi que de fournir des résultats logiques. Cependant les erreurs associées à ces hypothèses sont très difficiles à quantifier à ce stade de la production des estimations de population.

Nevertheless, the correction to the census population data due to net undercoverage improve, in general, the quality of the estimates through compensating for differential undercoverage by age, sex, marital status and province/territory for censuses. It has a direct impact on:

- the error of closure and its distribution by age, sex and marital status within provinces and territories as well as by province/territory as the net undercoverage and its distribution vary from one census to another;
- within-cohort consistency of population estimates (if, for example, a male cohort aged 0-4 in 1971 is traced from the 1976 to 1991 Censuses, the size of the 20-24 age group in 1991 is smaller than the 15-19 age group enumerated in 1986. Since Canada receives a large number of immigrants, and this population is, on average, younger than the Canadian population, this decrease is impossible. When these numbers are adjusted for net undercoverage, some growth is apparent in these cohorts).

Component data

● *Births and Deaths*

Since the law requires the recording of vital statistics, published final data used in the production of the revised intercensal estimates meet very high standards (99.9% in 1990 for Canada).

● *Marriages and Divorces*

These events are registered in the same manner as are births and deaths. The main problem arising from the use of these event data is the fact that vital statistics and Census use different definitions. In the Census, persons living in common-law unions are considered to be married, while vital statistics considers only legal marital status.

Néanmoins, la correction des données de recensement pour le sous-dénombrement net, améliore en général, la qualité des estimations en compensant pour le sous-dénombrement qui diffère d'un recensement à l'autre, par province et territoire et pour l'âge, le sexe et l'état matrimonial. Cela a un impact direct sur :

- l'erreur en fin de période et sa ventilation par âge, sexe et état matrimonial à l'intérieur d'une même province ou territoire, de même que par province ou territoire, étant donné la variation du sous-dénombrement net et de sa distribution d'un recensement à l'autre;
- la cohérence des estimations de population pour un même groupe de générations. Si, par exemple, on suit de 1976 à 1991 la cohorte masculine formée des 0-4 ans au recensement de 1971, elle est à 20-24 ans (en 1991) de plus petite taille qu'à 15-19 ans (en 1986). Comme le Canada reçoit beaucoup d'immigrants, parmi lesquels dominent les jeunes adultes, une telle diminution des effectifs est impossible. Après ajustement des effectifs pour le sous-dénombrement net, cette même cohorte manifeste l'accroissement attendu.

Composantes de l'accroissement

● *Naissances et décès*

Comme la loi requiert l'enregistrement des statistiques d'état civil, les données finales utilisées pour produire les estimations intercensitaires révisées sont de qualité très élevées (couverture de 99,9 % en 1990 pour l'ensemble du Canada).

● *Mariages et divorces*

Il en va de l'enregistrement de ces événements comme de celui des naissances et des décès. Le principal problème que présente l'utilisation des données relatives à ces événements, résulte du fait que l'état matrimonial n'est pas défini de la même façon à l'état civil qui retient la situation matrimoniale légale qu'au recensement, qui considère la situation de fait.

● *Immigration and Non-Permanent Residents*

Since immigration is controlled by law (the Immigration Act), data on immigrants and non-permanent residents are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist.

● *Returning Canadians*

The international movement of Canadian permanent residents is not under legal control and consequently a direct source of information on those who are returning to re-establish permanent residence in the country does not exist. The estimate of returning Canadians is based on assumptions concerning the proportion of emigrants returning to the country and their length of stay abroad. Moreover, as these assumptions are kept constant across provinces and territories, any relative geographical variation may introduce error into this component.

● *Emigration and Interprovincial Migration*

These estimates are more subject to error due to the use of administrative records that do not fully cover the universe under estimation. The data for these components considered as the best available, are derived from Revenue Canada tax files (Text Table IX).

● *Intraprovincial Migration*

The data for these components are derived from Revenue Canada tax files and considered as the best estimates available.

● *Level of Detail of Components*

As a more detailed breakdown of the data introduces larger inaccuracy into the estimates,

● *Immigration et résidents non permanents*

L'immigration étant contrôlée par une loi, les données sur les immigrants et les résidents non permanents sont systématiquement collectées à leur arrivée au Canada. Ces données ne concernent que l'immigration «légale» et excluent donc les immigrants illégaux. Ainsi, les données sur les entrées internationales «légales» au Canada sont considérées d'une qualité supérieure. Toutefois, des biais peuvent exister quant à la province de destination : celle envisagée par l'immigrant au moment de l'arrivée peut différer de celle où il résidera de fait.

● *Canadiens de retour*

Le mouvement international des résidents permanents du Canada n'est pas sous contrôle légal et par conséquent il n'existe pas d'information directe sur ceux qui, après émigration, reviennent s'établir au pays. L'estimation des Canadiens de retour repose sur des hypothèses relatives à la proportion d'émigrants rentrant au pays et à la durée de leur séjour à l'extérieur du pays. De plus, comme ces hypothèses valent pour chaque province ou territoire, toute variation géographique du flux pourrait entraîner une erreur dans l'estimation de cette composante.

● *Émigration et migration interprovinciale*

Ces estimations sont plus sujettes à erreur car on a recours à des fichiers administratifs qui ne couvrent pas entièrement l'univers visé par l'estimation. Les données définitives permettant d'estimer ces composantes, les meilleures disponibles, proviennent des fichiers sur l'impôt de Revenu Canada (tableau explicatif IX).

● *Migration intraprovinciale*

On estime cette composante à l'aide des données tirées des fichiers sur l'impôt de Revenu Canada. On considère l'estimation ainsi produite comme la meilleure possible.

● *Ventilation des composantes*

La finesse de la ventilation des données accroît les risques d'erreur de sorte que la qualité de

the possible error in components is augmented by the method used to distribute the estimates of totals by age, sex and marital status. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths, immigrants and non-permanent residents is concerned, and more significant with regard to the distribution of other components (emigrants, interprovincial migrants). Finally, the size of error due to the age/sex/marital status distribution may vary by postcensal period, and errors in some components may have a greater impact on a given age group or sex.

Population estimates

Assuming that the census counts adjusted for net undercoverage are accurate, the error of closure could be considered as a measure of reliability of the postcensal population estimates. Values of the error of closure are provided in Text Tables X to XII. When interpreting the figures from the table, the fact that the errors of closure are cumulated over a five-year period should be taken into account.

Intercensal estimates contain the same types of errors as postcensal estimates, as well as errors resulting from the way in which the errors present at the end of the period were distributed, that is, on the basis of the time elapsed since the reference census.

Census family estimates

The estimates of the total number and characteristics of families published herein contain a certain degree of error that comes, on one hand, from error inherent to the 1986 and 1991 Censuses, and on the other, from error resulting from other data sources and estimation methods.

Errors of census data

Certain errors are attributable to census data, specifically: (a) coverage errors; (b) response and processing errors, and; (c) errors arising from differences in some concept definitions.

l'estimation des composantes devient plus douteuse avec le fractionnement par âge, sexe et état matrimonial. Il semble qu'en général, les erreurs initiales soient moindres en ce qui concerne la ventilation des nombres annuels de naissances, de décès, d'immigrants et de résidents non permanents, qu'en ce qui a trait à celle des autres composantes (émigrants, migrants interprovinciaux). Enfin, l'importance de l'erreur causée par la distribution selon l'âge, le sexe et l'état matrimonial peut varier selon la période postcensitaire, et l'erreur relative à certaines composantes peut avoir un effet plus prononcé sur certains groupes d'âge ou sur un sexe donné.

Estimations de la population

Dans l'hypothèse où les données du recensement ajustées pour le sous-dénombrement net sont exactes, on peut considérer que l'erreur en fin de période mesure la fiabilité des estimations postcensitaires de la population. Les valeurs de l'erreur en fin de période sont présentées dans les tableaux explicatifs X à XII. Lors de leur interprétation, on devra se rappeler que les erreurs en fin de période sont cumulatives sur une période de cinq ans.

Les estimations intercensitaires sont entachées des mêmes erreurs que les estimations postcensitaires. À ces erreurs s'ajoutent celles provenant du mode de distribution des erreurs en fin de période en fonction du temps écoulé depuis le recensement servant de point de départ.

Estimations des familles de recensement

Les estimations du nombre total et des caractéristiques des familles publiées ici comportent une certaine marge d'imprécision qui provient d'une part des données des recensements de 1986 et 1991 et d'autre part des autres sources de données et des méthodes d'estimation.

Erreurs des données du recensement

Parmi les erreurs imputables aux données du recensement, on retrouve: a) les erreurs de couverture, b) les erreurs de réponse et de traitement; et c) les erreurs provenant des différences dans les définitions de certains concepts.

(a) Coverage errors are mainly attributable to undercoverage and overcoverage. Studies conducted following the 1991 Census allow quantification of the phenomenon. Unfortunately, data are unavailable for Censuses prior to 1991. The degree of net undercoverage varies from one province to another (Text Table VIII).

(b) The main response and processing errors arise from non-response, misinterpretation by respondents, coding errors, or from imputation of non-responses.

(c) There is a difference between the Census and the Vital Statistics definition of "family universe". Families belonging to collective households are not taken into account in census tabulations, while events experienced by the members of families, or non-family persons living in collective households, are registered by Vital Statistics. The magnitude of bias attributable to this difference is unknown.

a) Les erreurs de couverture sont dues principalement au sous-dénombrement et au surdénombrement. Les études menées suite au recensement de 1991 permettent de quantifier le phénomène. Malheureusement nous ne disposons d'aucune donnée pour les recensements antérieurs à 1991. L'importance du sous-dénombrement net varie d'une province à l'autre (tableau explicatif VIII).

b) Les principales erreurs de réponse et de traitement proviennent de non réponses, d'interprétations erronées des questions, du codage des données ou de l'imputation des non réponses.

c) L'univers des familles n'est pas identique au recensement et à l'état civil. En effet, les familles appartenant à des ménages collectifs ne sont pas prises en compte dans les tableaux de recensement, alors qu'au contraire, les événements survenant à des personnes vivant dans des ménages collectifs, qu'elles fassent ou non partie de familles, sont enregistrés à l'état civil. L'importance du biais attribuable à cette différence n'est pas connu.

Errors arising from estimation methods and from data sources other than census are difficult to estimate but are thought to be not negligible. Two types of bias can be distinguished: those related to estimation of components for which direct statistical information is not available, and those related to the events which are considered to cause formation or dissolution of families but are not taken into account in the estimation procedure due to lack of statistical information.

The first group encompasses migration of families (international and interprovincial), dissolution of families due to death of married, widowed or divorced persons, formation or dissolution of families related to common-law unions and changes in the number of non-permanent resident families.

The second group includes the formation of families by birth of a child whose parent is either a non-family person or who is a child living with the family, and dissolution of families due to separation, annulment of legal marriage, and the death or departure of a sole child in a lone-parent family.

Furthermore, families in collective households are not taken into account in census tabulations, while events

Les erreurs provenant des méthodes d'estimation et des sources de données autres que le recensement sont difficiles à estimer mais ne sont pas négligeables pour autant. On peut distinguer deux types de biais: ceux reliés à l'estimation des composantes pour lesquelles les données directes ne sont pas disponibles et ceux reliés à des événements entraînant la formation ou la dissolution de familles mais que le mode d'estimation ignore, faute de données.

Le premier type de biais touche la migration des familles (internationale et interprovinciale), la dissolution des familles due au décès de personnes mariées, veuves ou divorcées, la formation ou la dissolution de familles créées par union consensuelle et la variation du nombre de familles de résidents non permanents.

Le second type de biais inclut la formation de familles par la naissance d'un enfant dont le parent est, ou bien une personne hors famille, ou bien un enfant vivant dans une famille, et la dissolution de familles due à la séparation, à l'annulation d'un mariage légal, et au décès ou au départ de l'enfant unique d'une famille monoparentale.

De plus, les familles vivant dans des logements collectifs ne sont pas comptées dans l'effectif de base, alors que les

occurring to members of collective households or to non-family persons living in collective households are registered by the Health Statistics Division. The magnitude of bias attributable to these differences is unknown.

événements subis par les membres des ménages collectifs ou par des personnes hors famille vivant dans des ménages collectifs sont inclus dans les données de la Division des statistiques sur la santé. L'ampleur du biais attribuable à ces différences est inconnue.

(IR) Revised intercensal data. - Données intercensitaires révisées.

(PR) Updated postcensal data. - Données postcensitaires mises à jour.

(1) Year ending June 30. - Année se terminant le 30 juin.

(2) Based on geographical boundaries as delineated in the 1991 Census. - Selon le découpage géographique en vigueur lors du recensement de 1991.

(3) Annual growth is obtained by subtracting the intercensal population estimate year t, from year t + 1. - L'accroissement annuel est obtenu en soustrayant l'estimation de la population de l'année t de celle de l'année t + 1.

(4) Residual deviation is obtained by subtracting the ten components from the annual growth. - On obtient l'écart résiduel en soustrayant de l'accroissement annuel les dix composantes.

N.P.R. / R.N.P. : Net change of Non-Permanent Residents - Solde des Résidents Non Permanents

Ret. Can. / Can. Ret. : Returning Canadians - Canadiens de Retour

(IR) Revised intercensal data. - Données intercensitaires révisées.

(PR) Updated postcensal data. - Données postcensitaires mises à jour.

(1) Year ending June 30. - Année se terminant le 30 juin.

(2) Based on geographical boundaries as delineated in the 1991 Census. - Selon le découpage géographique en vigueur lors du recensement de 1991.

(3) Annual growth is obtained by subtracting the intercensal population estimate year t, from year t + 1. - L'accroissement annuel est obtenu en soustrayant l'estimation de la population de l'année t de celle de l'année t + 1.

(4) Residual deviation is obtained by subtracting the ten components from the annual growth. - On obtient l'écart résiduel en soustrayant de l'accroissement annuel les dix composantes.

N.P.R. / R.N.P. : Net change of Non-Permanent Residents - Solde des Résidents Non Permanents

Ret. Can. / Can. Ret. : Returning Canadians - Canadiens de Retour

Revised Intercensal Population and Family Estimates, July 1, 1971-1991
 Estimations intercensitaires révisées de la population et des familles au 1^{er} juillet 1971-1991

Table 2.1 Census Families, Canada, Provinces and Territories, July 1, 1986 to 1991

GLOSSARY

Aging (of a Population)

An increase in the number of old persons as a percentage of the total population.

Average Absolute Error of Closure

Defined as the mean of the absolute percent differences between the postcensal estimates and the population adjusted for net undercoverage according to a census for the same date.

Base Population

The base population corresponds to the enumerated population of each census, adjusted to July 1 and corrected for net census undercount.

Birth Cohort or Generation

Unless otherwise specified, refers here to a group of persons born within the 12-month period between July 1 of a given year and June 30 of the following year.

Census Coverage

Net undercoverage

Difference between undercoverage and overcoverage.

Overcoverage

Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage

Number of persons not enumerated in a census (who were intended to have been enumerated).

Census Division (CD)

Refers to the general term applying to geographic areas established by provincial law, which are intermediate geographic areas between the census subdivision and the province (e.g., divisions, counties, regional districts, regional municipalities and seven other types of geographic areas made up of groups of census subdivisions).

In Newfoundland, Manitoba, Saskatchewan and Alberta, provincial law does not provide for these administrative geographic areas. Therefore, census divisions have been created by Statistics Canada in co-operation with these provinces (1991 *Census Dictionary*, Catalogue No. 92-301E, page 180).

Census Family

Refers to a now-married couple (with or without never-married sons and/or daughters of either or both spouses), a couple living common-law (again with or without never-married sons and/or daughters of either or both partners), or a lone parent of any marital status, with at least one never-married son or daughter living in the same dwelling. (Statistics Canada, *The Nation*, Catalogue No. 93-312).

Census Metropolitan Area (CMA)

The general concept of a census metropolitan area (CMA) is one of a very large urban area, together with adjacent urban and rural areas which have a high degree of economic and social integration with that urban area.

A CMA is delineated around an urban area (called the urbanized core and having a population of at least 100,000 based on the previous census. Once an area becomes a CMA, it is retained in the program even if its population subsequently declines.

CMAs are comprised of one or more census subdivisions (CSDs) which meet at least one of the following criteria: (1) the CSD falls completely or partly inside the urbanized core; (2) at least 50 % of the employed labour force living in the CSD works in the urbanized core; or (3) at least 25 % of the employed labour force working in the CSD lives in the urbanized core (*1991 Census Dictionary*, Catalogue No. 92-301E, page 182).

Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 1983 consists of the number of persons who married in 1983. Persons born within a specified year could be referred to as a generation.

Common-law Union

Union consisting of a male and a female living together as husband and wife, without being legally married.

Components of Demographic Change

Any of the classes of events generating population movement variations. Births, deaths, migration, marriages, divorces and new widowhoods are the components responsible for the change in total population or in the age, sex and marital status distribution of the population.

Error of Closure

Difference between the postcensal estimate and the population adjusted for net undercoverage according to a census for the same date.

Family Structure

Census families are classified as follows:

Husband-wife Family. A husband-wife family consists of a legally-married male and female (with or without never-married children, regardless of age), or two persons living in a common-law union (with or without never-married children, regardless of age).

Lone-parent Family. A lone-parent family consists of a father or a mother, with one or more never-married children, regardless of age, living in the same dwelling.

International Migration

Movement of population between Canada and a foreign country which involves a permanent change in residence. A distinction is made between landed immigrants, non-permanent residents and returning Canadians from other countries who settle in Canada, and emigrants and non-permanent residents who leave Canada.

Interprovincial Migration

Movement from one province to another involving a permanent change in residence. A person who takes up residence in another province is an out-migrant with reference to the province of origin, and an in-migrant with reference to the province of destination.

Intraprovincial Migration

Movements of population from one census division or census metropolitan area to another within a province, involving a permanent change in residence.

Marital Status

Indicates the conjugal status, that is whether single, married, widowed or divorced.

Married - Includes persons legally married, legally married and separated and persons living in common-law unions.

Single - Includes persons who have never been married and all persons under 15 years of age.

Although the number of married males and females should be theoretically identical, it is not the case as can be seen in the 1991 Census data which shows 6,591,580 married males and 6,548,740 married females. The main reasons for this discrepancy (42,840) are:

Common-law unions. Persons who were single, widowed or divorced, but who indicated that they were living in a common-law union at the time of the 1991 Census, were considered to be married persons. This process involved the addition of 680,780 females, but only 668,695 males, to the married population. This resulted in a net transfer of 12,095 excess females to the status of married.

International migration. Between June 1, 1986 and May 31, 1991, 192,488 married males and 202,356 married females arrived in Canada as landed immigrants or non-permanent residents.

Net Census underenumeration. The extent of census underenumeration varies by sex. For example, in 1991, the undercoverage rate for married males was 1.50% whereas that for married females was 1.13%. This differential explains approximately 40% of the total difference.

Response errors. In response to the question on marital status, some married persons absent from home may have declared themselves as single while their spouse reported their marital status as married.

Mean Age

The mean age of a population is the average age of all its members.

Median Age

The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

Natural Increase

Excess of births over deaths.

Non-permanent Residents

The five following groups are referred to as non-permanent residents:

- persons residing in Canada claiming refugee status;
- persons residing in Canada who hold a student authorization (foreign students, student visa holders);
- persons residing in Canada who hold an employment authorization (foreign workers, work permit holders);
- persons residing in Canada who hold a Minister's permit;
- all non-Canadian born dependents of persons claiming refugee status, or of persons holding student authorizations, employment authorizations or Minister's permits living in Canada.

Number of Complete Years Lived

Age at last birthday.

Population

Estimated population and population according to the 1991 Census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered "non-permanent residents".

Population Estimates

(a) Preliminary, Updated and Final Postcensal

Population estimates produced by using data from the most recent census adjusted for net census undercoverage and estimates of the components of demographic change since that last census.

(b) Intercensal

Population estimate derived by using postcensal estimates and data from the most recent census counts adjusted for net undercoverage preceding and following the year in question.

Population Growth

Change in population size from one date to another.

Rate

Net Undercoverage of Population or Census Families: Difference between undercoverage rate and overcoverage rate.

Overcoverage of Population or Census Families: The ratio expressed in percentage of the number of persons or census families who should not have been counted in the census or who were counted more than once to the total number of persons or census families that should have been enumerated in the census.

Population Growth: Growth in percentage of population P between the year t and t+1, calculated on the basis of the average population.

Undercoverage of Population or Census Families: The ratio, expressed in percentage, of the estimated number of persons or census families not enumerated in the census (who were intended to have been enumerated) to the total number of persons or census families that should have been enumerated in the census.

Residual

Difference between population growth as measured by population estimates of two consecutive years and the sum of the components. This difference results from the distribution of the closure error between years within the quinquennial period.

Returning Canadians

Canadian citizens who emigrated from the country in a given year and who subsequently returned to Canada permanently.

Vital Events

Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Year

Refers to the period beginning July 1 of a given year and ending June 30 of the following year.

LEXIQUE

Accroissement démographique

Variation de l'effectif de la population entre deux dates.

Accroissement naturel

Excédent des naissances sur les décès.

Âge en années révolues

Âge au dernier anniversaire.

Âge médian

L'âge médian est l'âge «x» tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à «x», l'autre des individus d'âge inférieur à «x».

Âge moyen

L'âge moyen d'une population est la moyenne des âges de ses membres.

Année

La période qui s'étend du 1^{er} juillet d'une année au 30 juin de l'année suivante.

Canadiens de retour

Des citoyens canadiens qui ont émigré du pays une année donnée et qui reviennent s'installer de façon permanente au Canada.

Cohorte

Ensemble des personnes touchées par un phénomène démographique particulier une année donnée. La cohorte des mariés de 1983 désigne donc l'ensemble des personnes qui se sont mariées en 1983. La cohorte, dans le cas des naissances, porte le nom de génération.

Complétude du recensement

Sous-dénombrement

Nombre de personnes qui n'ont pas été recensées (mais qui étaient visées par le recensement).

Sous-dénombrement net

Différence entre le sous-dénombrement et le surdénombrement.

Surdénombrement

Nombre de personnes qui n'auraient pas dû être recensées ou qui l'ont été plus d'une fois.

Composantes de l'accroissement démographique

Chacune des classes d'événements générateurs des mouvements ou variations de population. Ainsi les naissances, décès, migrations, mariages, divorces et entrées en veuvage sont des composantes, car elles altèrent soit l'effectif de la population totale, soit sa composition selon l'âge, le sexe et l'état matrimonial.

Division de recensement (DR)

Terme générique qui désigne les régions géographiques établies en vertu de lois provinciales et qui constituent les régions intermédiaires entre la subdivision de recensement et la province (par exemple, divisions, comtés, districts régionaux, municipalités régionales et sept autres genres de régions géographiques formées d'un regroupement de subdivisions de recensement).

Les lois provinciales de Terre-Neuve, du Manitoba, de la Saskatchewan et de l'Alberta ne prévoient pas la création de ces régions administratives. C'est pourquoi les divisions de recensement ont été établies par Statistique Canada dans ces provinces en collaboration avec elles (*Dictionnaire du recensement de 1991*, n° 92-301F au catalogue, page 207).

Estimations de la population

a) Postcensitaires provisoire, mise à jour et définitive

Estimations de l'effectif de la population obtenues en utilisant les résultats du dernier recensement disponible ajusté pour le sous-dénombrement net et l'estimation de l'accroissement démographique survenu depuis la date de ce dernier recensement.

b) Intercensitaire

Estimation de l'effectif de la population obtenue en utilisant les estimations postcensitaires et les résultats ajustés pour le sous-dénombrement net des deux recensements encadrant l'année considérée.

Erreur absolue moyenne en fin de période

Moyenne des valeurs absolues des écarts relatifs entre les populations recensées et estimées.

Erreur en fin de période

Différence entre la population donnée par un recensement ajusté pour le sous-dénombrement net et l'estimation postcensitaire à la date du recensement.

État matrimonial

Indique la situation conjugale. On ne considère que quatre possibilités : célibataire, marié(e), veuf(ve), divorcé(e).

Célibataire - Comprend les personnes qui n'ont jamais été mariées et toutes les personnes de moins de 15 ans.

Marié - Comprend les personnes légalement mariées, légalement mariées et séparées, et les personnes vivant en union consensuelle.

Bien que, théoriquement, le nombre de personnes mariées doit être identique pour chacun des sexes, il n'en est pas ainsi comme on peut le constater au recensement de 1991 (6 591 580 hommes mariés et 6 548 740 femmes mariées). Les principales raisons pour cette différence (42 840) sont les suivantes :

Erreurs de réponse. À la question traitant de l'état matrimonial, certaines personnes mariées absentes de la maison ont pu se déclarer célibataires tandis que leurs conjoints à la maison ont indiqué qu'ils étaient mariés.

Migration internationale. Du 1^{er} juin 1986 au 31 mai 1991, 192 488 hommes mariés et 202 356 femmes mariées sont entrés au Canada comme immigrants reçus ou résidents non permanents.

Sous-dénombrement net. L'importance du sous-dénombrement au recensement varie selon le sexe. En 1991, le taux de sous-dénombrement pour les hommes mariés était de 1,50 %, alors que celui des femmes mariées était de 1,13 %. Cet écart en nombre absolu explique approximativement 40 % de la différence observée.

Unions consensuelles. Les personnes célibataires, divorcées ou veuves, vivant en union libre au moment du recensement de 1991, ont été considérées comme personnes mariées. Cette opération a entraîné l'addition de 680 780 femmes et de seulement 668 695 hommes mariés, soit une différence de 12 095.

Famille de recensement

Couple actuellement marié (avec ou sans fils et/ou filles jamais mariés des deux conjoints ou de l'un des deux), couple vivant en union libre (avec ou sans fils et/ou filles jamais mariés des deux partenaires ou de l'un des deux) ou parent seul (peu importe son état matrimonial) demeurant avec au moins un fils ou une fille jamais marié. (Statistique Canada, Le Pays, n° 93-312 au catalogue).

Génération

Désigne ici, sauf indication contraire, l'ensemble des personnes nées durant la période de 12 mois, comprise entre le 1^{er} juillet d'une année et le 30 juin de l'année suivante.

Migration infraprovinciale

Ensemble des déplacements d'une division de recensement ou d'une région métropolitaine de recensement vers une autre à l'intérieur de la même province, accompagnés d'un changement permanent de résidence.

Migration internationale

Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement permanent de résidence. On distingue à cet égard les immigrants reçus, les résidents non permanents et les Canadiens de retour qui viennent s'établir au Canada et les émigrants ainsi que les résidents non permanents qui quittent le Canada.

Migration interprovinciale

Ensemble des déplacements d'une province vers une autre, accompagnés d'un changement permanent de résidence. Un individu qui effectue un tel déplacement sera un sortant pour sa province d'origine et un entrant pour sa province de destination.

Population

La population estimée répond à la même définition que celle du recensement de 1991. Pour un lieu donné, la population se définit comme le nombre des Canadiens qui y ont leur résidence habituelle, sans égard au lieu où ils se trouvaient le jour du recensement. Sont également comptés les Canadiens séjournant dans un logement de la région en cause le jour du recensement et n'ayant pas de lieu habituel de résidence ailleurs au Canada, de même que ceux qui sont considérés comme des résidents non permanents.

Population de départ

La population de départ correspond à la population énumérée à chaque recensement, ajustée au 1^{er} juillet et corrigée pour le sous-dénombrement net au recensement.

Région métropolitaine de recensement (RMR)

Le concept général de région métropolitaine de recensement (RMR) s'applique à un grand noyau urbain ainsi qu'aux régions urbaines et rurales adjacentes dont le degré d'intégration économique et sociale avec ce noyau urbain est très élevé.

Une RMR est délimitée à partir d'un noyau urbanisé lorsque ce dernier compte au moins 100 000 habitants, (d'après les résultats du recensement précédent). Lorsqu'une région devient une RMR, elle continue de faire partie du programme même si, ultérieurement, elle subit une baisse de population.

Chaque RMR est constituée d'une subdivision de recensement (SDR) ou plus répondant à au moins un des critères suivants: (1) la SDR se trouve entièrement ou en partie dans le noyau urbanisé; (2) au moins 50 % de la population active occupée demeurant dans la SDR travaille dans le noyau urbanisé; (3) au moins 25 % de la population active occupée travaillant dans la SDR demeure dans le noyau urbanisé (*Dictionnaire du recensement de 1991*, n° 92-301F au catalogue, page 222).

Résidents non permanents

Les cinq groupes suivants constituent ce qu'on définit comme résidents non permanents :

- les personnes résidant au Canada qui demandent le statut de réfugié;
- les personnes résidant au Canada qui détiennent un permis de séjour pour étudiants (les étudiants étrangers, les titulaires d'un visa pour étudiants);
- les personnes résidant au Canada qui détiennent un permis de travail (les travailleurs étrangers, les titulaires d'un permis de travail);
- les personnes résidant au Canada qui détiennent un permis ministériel;
- toutes les personnes nées à l'extérieur du Canada, qui sont à charge des revendicateurs du statut de réfugié ou des titulaires d'un permis de séjour pour étudiants, d'un permis de travail ou d'un permis ministériel et qui résident au Canada.

Résidu

Différence entre l'accroissement démographique à partir des effectifs de la population de deux années consécutives et celui obtenu par la somme des composantes. Cette différence résulte de la répartition de l'erreur en fin de période entre les différentes années de la période quinquennale concernée.

Statistiques de l'état civil

Elles couvrent l'ensemble des événements démographiques (i.e. les naissances, les décès, les mariages et les divorces) pour lesquels il existe une obligation légale d'aviser le bureau du registraire de la province ou du territoire.

Structure de la famille de recensement

Les familles de recensement sont classées de la façon suivante:

Famille époux-épouse. Une famille époux-épouse se compose d'un homme et d'une femme légalement mariés (avec ou sans enfants célibataires, peu importe leur âge) ou de deux personnes vivant en union consensuelle (avec ou sans enfants célibataires, peu importe leur âge).

Famille monoparentale. Une famille monoparentale se compose d'un père ou d'une mère, ayant un ou plusieurs enfants célibataires, peu importe leur âge, vivant dans le même logement.

Taux

Accroissement démographique: accroissement en pourcentage de la population P entre l'année t et t + 1, calculé à partir de la population moyenne de ces deux années.

Sous-dénombrement de la population ou des familles de recensement: rapport, exprimé en pourcentage, du nombre estimé de personnes ou de familles de recensement qui n'ont pas été recensées (mais qui étaient visées par le recensement) à celui de l'ensemble des personnes ou des familles de recensement visées par le recensement.

Sous-dénombrement net de la population ou des familles de recensement: différence entre le taux de sous-dénombrement et le taux de surdénombrement.

Surdénombrement de la population ou des familles de recensement: rapport exprimé en pourcentage du nombre de personnes ou des familles de recensement qui n'auraient pas dû être recensées ou qui l'ont été plus d'une fois au nombre total des personnes ou des familles de recensement visées par le recensement.

Union consensuelle ou union libre

Union formée d'un homme et d'une femme demeurant ensemble comme époux-épouse, sans être légalement mariés.

Vieillesse démographique

Évolution caractérisée par une augmentation de la proportion des personnes âgées au sein d'une population.

REPORT ON THE DEMOGRAPHIC SITUATION IN CANADA, 1993

The 1993 edition of the *Report on the Demographic Situation in Canada*, is now available.

The first part of the report analyzes the most recent demographic trends. We often hear that the youth have been affected by unemployment. But it should be realized that it is a group of generations that may have suffered. Recently those born between 1956 and 1960 have been particularly tried... The number of marriages in 1991 has fallen by more than 8% compared with 1990... a decline without parallel in Canadian history.

The second part describes the Mexican demographic situation and its challenges, which assume greater importance with the development of closer relations between the two countries.

To obtain the *Report on the Demographic Situation in Canada, 1993* (91-209E, \$26), contact your nearest Statistics Canada Regional Office.

RAPPORT SUR L'ÉTAT DE LA POPULATION DU CANADA, 1993

L'édition 1993 du *Rapport sur l'état de la population du Canada*, est maintenant disponible.

La première partie est consacrée à l'analyse des tendances démographiques les plus récentes. On entend souvent que les jeunes sont affectés par le chômage. Il faut se rendre compte que ce sont des groupes de générations qui peuvent avoir souffert. Dans le récent passé ce sont celles de 1956 à 1960 qui ont été particulièrement éprouvées... Le nombre de mariages en 1991 a chuté de plus de 8 % par rapport à 1990... du jamais vu dans l'histoire du Canada.

La seconde partie est une description de la situation démographique du Mexique et de ses problèmes qu'il est bon de connaître au moment où ses relations s'intensifient avec le Canada.

Pour obtenir le *Rapport sur l'état de la population du Canada, 1993* (91-209F, 26 \$), communiquez avec le Centre de consultation le plus près.

Are you getting your information on the Canadian economy "first-hand"?

Chances are, you spend hours reading several newspapers and a handful of magazines trying to get the whole economic picture – only to spend even more time weeding out fiction from fact! Wouldn't it be a great deal more convenient (and much more effective) to go straight to the source?

Join the thousands of successful Canadian decision-makers who turn to Statistics Canada's *Canadian Economic Observer* for their monthly briefing. Loaded with first-hand information, collectively published nowhere else, CEO is a quick, concise and panoramic overview of the Canadian economy. Its reliability and completeness are without equal.

A single source

Consultations with our many readers – financial analysts, planners, economists and business leaders – have contributed to CEO's present, widely acclaimed, two-part format. The **Analysis Section** includes thought-provoking commentary on current economic conditions, issues, trends and developments. The **Statistical Summary** contains the complete range of hard numbers on critical economic indicators: markets, prices, trade, demographics, unemployment and more.

More practical, straightforward and user-friendly than ever before, the *Canadian Economic Observer* gives you more than 150 pages of in-depth information in one indispensable source.

Why purchase CEO?

As a subscriber, you'll be directly connected to Statistics Canada's economic analysts. Names and phone numbers of the experts who can help solve your particular research problem or find specialized data are listed with articles and features.

You'll also receive a complimentary copy of CEO's annual **Historical Statistical Supplement**. Sixty years of historical perspectives right at your fingertips – at no additional cost.

So why wait for others to publish Statistics Canada's data second-hand when you can have it straight from the source? Order your subscription to the *Canadian Economic Observer* today.

The *Canadian Economic Observer* (catalogue number 10-230) is \$220 annually in Canada, US\$260 in the United States and US\$310 in other countries.

To order, write: Statistics Canada

Sales and Service
Ottawa, Ontario, K1A 0T6

or contact the nearest Statistics Canada Reference Centre listed in this publication.

If more convenient, fax your order to 1-613-951-1584 or call toll-free 1-800-267-6677 and use your VISA or MasterCard.

Recevez-vous directement vos informations sur l'économie canadienne?

Il est probable que vous passez des heures à lire plusieurs journaux et un paquet de revues pour essayer d'avoir une vue complète de la situation économique, et ensuite passer encore plus de temps à séparer le réel de ce qui ne l'est pas. Ne serait-il pas plus pratique (et beaucoup plus efficace) de remonter directement à la source?

Joignez-vous aux milliers de décideurs canadiens gagnants qui lisent *L'Observateur économique canadien* pour leur séance de rapport mensuelle. Rempli de renseignements disponibles nulle part ailleurs, l'OEC permet d'avoir une vue générale rapide et concise de l'économie canadienne. Il est inégalé par sa fiabilité et son exhaustivité.

Une seule source

Les consultations que nous avons eues avec nos nombreux lecteurs, des analystes financiers, des planificateurs, des économistes et des chefs d'entreprise, nous ont permis de présenter l'OEC dans son format actuel en deux parties, qui a été bien accueillie. La **section de l'analyse** contient des commentaires qui donnent à réfléchir sur la conjoncture économique, les problèmes, les tendances et les développements. L'**aperçu statistique** contient l'ensemble complet des chiffres réels pour les indicateurs économiques essentiels : les marchés, les prix, le commerce, la démographie, le chômage et bien d'autres encore.

Plus pratique, plus simple, plus facile à utiliser qu'auparavant, *L'Observateur économique canadien* vous offre plus de 150 pages de renseignements poussés sous une seule couverture.

Pourquoi acheter l'OEC?

En tant qu'abonné à l'OEC, vous êtes directement relié aux analystes économiques de Statistique Canada. Le nom et le numéro de téléphone des experts qui peuvent vous aider à résoudre vos problèmes particuliers de recherche ou trouver des données spécialisées sont cités dans les articles et les rubriques de l'OEC.

Vous recevrez également un exemplaire gratuit du **Supplément statistique historique** annuel. Vous aurez ainsi devant vous soixante années de données rétrospectives et ce, à titre gracieux.

Pourquoi devez-vous donc attendre que d'autres publient les données de Statistique Canada qu'ils ont reprises alors que vous pouvez les obtenir directement à la source? Abonnez-vous à *L'Observateur économique canadien* dès aujourd'hui.

Le prix de l'abonnement annuel à *L'Observateur économique canadien* (n° 10-230 au catalogue) est de 220 \$ au Canada, de 260 \$ US aux États-Unis et de 310 \$ US dans les autres pays.

DEMOGRAPHICS MADE EASY

Every day you read news items about immigration, aging of the population, fertility or population growth rates. Unfortunately, these stories are often fragmented, making it difficult to get a complete picture of the demographic situation in Canada.

Statistics Canada's annual **Report on the Demographic Situation in Canada, 1991** is written to help you understand these demographic interactions, and their effects. You'll see for example, how increases in life expectancy have affected the number of senior couples, and how a well-designed analysis suggests that financial incentives may not have had any effect on fertility in Quebec.

Population growth, immigration rates and population movement between provinces . . . it's all there! You'll find data and analysis on a wide range of topics presented in both a geographic and historical context. And, in many instances, international comparisons are provided. With a sound understanding of current trends, you'll be well positioned to draw your own conclusions about what the future may hold.

Report on the Demographic Situation in Canada, 1991 contains more than 60 tables, many revealing graphs and a concise, easy-to-read text. A handy glossary is also provided which will help newcomers master unfamiliar technical terms.

Subscribe to **Report on the Demographic Situation in Canada, 1991** (catalogue #91-209E) for only \$26 (plus \$1.82 GST) in Canada, US\$31 in the United States, and US\$36 in other countries.

LA DÉMOGRAPHIE C'EST FACILE

L'immigration, le vieillissement de la population, la fécondité et le taux de croissance de la population font régulièrement la « une » des journaux. Malheureusement, ces nouvelles fragmentées nous cachent souvent la situation démographique complète du pays.

Rapport sur l'état de la population du Canada, 1991, publication annuelle de Statistique Canada, vous aidera à saisir toutes les interactions des événements démographiques et leurs effets. Vous verrez, par exemple, comment les gains en espérance de vie peuvent avoir une influence sur le nombre de couples du troisième âge, et comment une analyse bien conçue démontre que les motivations financières n'ont présenté aucun effet sur la fécondité au Québec.

La croissance de la population, les taux d'immigration et les mouvements de la population à travers les provinces . . . tout y est. Vous trouverez des données et des analyses sur une vaste gamme de sujets présentés à la fois dans un contexte historique et géographique. Sont également fournies, des comparaisons internationales. Guidé dans l'analyse de la situation présente, il vous sera alors plus facile d'imaginer l'évolution à venir.

Rapport sur l'état de la population du Canada, 1991 contient plus de 60 tableaux, de nombreux graphiques explicatifs et un texte facile à lire. En outre, son glossaire permettra aux novices de maîtriser des termes techniques et de s'exprimer sans ambiguïté sur les phénomènes de la population canadienne.

Rapport sur l'état de la population du Canada, 1991 (n° 91-209F au Catalogue) se vend seulement 26 \$ (plus 7 % de TPS) au Canada, 31 \$ US aux États-Unis et 36 \$ US dans les autres pays.
